Again, we learn that a young lady appointed to meet a gentlewoman at the Old Playhouse, Drury Lane; but something prevented the gentlewoman coming, and the young lady being alone when the play was over, told a boy to fetch a coach for the city. 'One like a gentleman helps her into it and jumps in after her. "Madam," says he, "this coach was called for me; and since the weather is bad and there is no other, I beg leave to bear you company. I am going into the city, and will set you down wherever you please."

The girl begged to be excused; but the man told the coachman to drive on. The result was that she was driven to a house, where she was induced to go in on the pretext of seeing the man's sister, who would accompany her the rest of the journey. The sister came, but immediately vanished, and in her place appeared a 'tawny fellow in a black coat and black wig,' who said: 'Madam, you are come in good time; the doctor was just going!'

'The doctor!' exclaimed the girl; 'what has the doctor to do with me?'

'To marry you to that gentleman. The doctor has waited for you these three hours, and will be paid by you or that gentleman before you go!'

'That gentleman,' replied the girl, recovering herself, 'is worthy a better fortune than mine,' and begged to be allowed to go; but the men were obdurate; and when she found she could not escape without money or pledge, told them that she liked the gentleman so much, that she would meet him the next night and be married; but they did not allow her to go before she had given them some pledge, and she therefore gave them a ring, which, to quote her words, 'was my mother's gift on her death-bed, enjoining that, if ever I married, it should be my wedding ring;' and by this means she escaped.

The indecency of these practices, and the facility they afforded for accomplishing forced and fraudulent marriages, were not the only evils, for we are told that marriages, when entered in the register, could be antedated without limit, on payment of a fee, or not entered at all; and women frequently hired temporary husbands at the Fleet, in order that they might be able to plead marriage to an action for debt. These hired husbands were provided by the parsons at five shillings each; and we are told that one man was married four times under different names, and received five shillings on each occasion 'for his trouble.'

That the parsons did not always get the best of it may be supposed from the following extract from the register of the Fleet Marriages: '1740. Geo. Grant and Ann Gordon, bachelor and spinster: stole my clothes-brush.'—'Married at a barber's shop next Wilson's—namely, one Korrlis, for half a guinea; after which it was extorted out of my pocket, and for fear of my life, delivered.'

We are told that all sorts and conditions of men flocked to the Fleet to be married in haste, from the barber to the officer in the Guards—from the pauper to the peer. Timbs, in his book on *London*, states that among the aristocratic patrons of these unlicensed clergy were Lord Abergavenny; the Honourable John Bourke, afterwards Viscount Mayo; Sir Marnaduke Gresham; Lord Banff; Lord Montague, afterwards Duke of Manchester; Viscount Sligo; the Marquis of Annandale; Henry Fox, afterwards Lord Holland; and others. Walpole writes to Sir Horace Mann about Fox's marriage as follows: 'The town has been in a great bustle about a private match, but which, by the ingenuity of the ministry, has been made politics. Mr Fox fell in love with Lady Caroline Lennox (eldest daughter of the Duke of Richmond), asked her, was refused, and stole her. His father was a footman; her great-grandfather, a king. All the blood-royal have been up in arms.'

The Bishop of London attempted to put a stop to these marriages in 1702, but with very little effect; and it was not until 1754 that an Act of Parliament was passed to prevent them. It is stated that the day before the Act was to come into force (March 24), there were no fewer than two hundred and seventeen marriages recorded in one register book; and these were the last of the Fleet weddings.

A collection of the registers of Fleet Marriages was made in 1821, and was purchased by the government; they weighed over a ton.

After the Marriage Bill of 1754, the Savoy Chapel came into vogue. The following advertisement appeared in *'the Public Advertiser'* of January 2, 1754: 'By authority—Marriages performed with the utmost privacy, decency, and regularity—in the ancient royal chapel of St John the Baptist, in the Savoy, where regular and authentic registers have been kept from the time of the Reformation (being two hundred years and upwards) to this day. The expenses not more than one guinea—the five-shilling stamp included. There are five private ways by land to this chapel, and two by water.'

The proprietor of this chapel was the Rev.

John Wilkinson, who fancied—as the Savoy was extra-parochial—that he was privileged to issue licenses upon his own authority, and so took no notice of the Act. During the following year, 1755, he married no fewer than eleven hundred and ninety couples. The authorities at last took the matter up, and Wilkinson went into hiding; but he got a curate named Grierson to perform the ceremonies, he still giving the licenses, by which he thought his assistant would be harmless; but this was not so. Two members of the Drury Lane company were united by Grierson; and Garrick hearing of this, obtained the certificate, and had Grierson arrested. He was tried, convicted, and sentenced to fourteen years' transportation; by which sentence, we are told, fourteen hundred marriages were declared void. We are not told what became of Wilkinson, whose trade was thus put a stop to.

TO A LADY.

AGAIN I welcome the familiar pen;

Again I sit me down to think and write:
Fairly and free should flow my fancies when

So fair a subject calls me to indite.

And thou, O Muse, whose gracious fingers oft,
And ne'er, I trust, in vain, have beckoned me,
Grant that thy spirit, breathing numbers soft,
May now descend to aid thy humblest votary.

So, when the lark, in fullest tide of song,
Makes sudden pause amidst his music clear,
As seeking which, of all the thoughts that throng,
First to embody for the listening ear,
So do I hesitate and pause, in doubt

With such diversity where to begin,
For outward eyes would praise those charms without,
Whilst Love would greet the soul enshrined those
charms within.

Ah, gracious lady, words alone are vain
Thy finer, subtler traits to fully show;
Rather Apollo's art, in sweetest strain,
With long-drawn symphonies, as soft as low,
And cunningly devised by master-hand,
Thy worth and beauty better would express
Than my rude phrases—serving but to stand
As tokens of thy power and of my faithfulness.

Yet tokens true are they; as tender shoots,
Just peeping through the earth, are aeries good
That deep below are hidden strongest roots,
Which give this evidence of lustihood,
So doth the love, long 'prisoned in my breast,
Forced by its growth, at length expression find;
I place my life, my all, at thy behest;
I could not love thee more, nor oaths could stronger
bind.

Yet what are words! More breaths which pass away;
And words are at the service of us all.
Vows, true or false, ring all the same to-day;
We by our after-actions stand or fall.
Give me to do some deed, some work, to show
And prove the love I bear thee; test my faith.
I speak no more; in silence, love shall grow,
And silent witness give that love shall last till
death.

CAVE-HUNTING IN YORKSHIRE.

THE finest county in all England is the great shire of York, with its rugged coast, and its rolling plains dotted with many a noble church, its wild moorlands and lofty fells, its fertile valleys with their monastic ruins and crumbling castle-keeps. Every Yorkshireman is proud of his county, whether he be foxhunting Squire, lord of thousands of its acres, or merchant-prince—a brawny artisan, toiling in one of its great manufacturing towns, or a stalwart daleman—a miner drifting for lead in the north-west, or a pitman burrowing for coal in the south—the sturdy yeoman-farmer of the wolds, or bluff fisherman on the shores of the wild North Sea—for is it not a very epitome of his country?

Micklefoll, Wharfedale, Ingleborough, Pen-y-ghent, and many a mountain crest on the west, the hold chalk heathland and wondrous caverns of Flamborough, with the romantic stretch of cliffs round Robin Hood Bay to eastward, afford scenery of the grandest description. Swaledale, Teesdale, Wensleydale, Niddersdale, and Wharfedale, with the rich plain of York beyond stretching away to the tilted slopes of the wolds and Hambleton Hills, are gems of softer beauty. The big towns of Leeds, Sheffield, Bradford, Wakefield, are seats of busy commerce, whose black smoke pollutes the air, whilst the snorting engine and thundering steam-hammer resound both night and day. The broad Humber bears on its tide-ruffled bosom great fleets from Hull and Goole, which carry their wares to every corner of the world. Fountains, Bolton, Rievaulx, Kirkstall, Pervaulx, and lesser abbeys, tell of past glories; whilst York, Ripon, Selby, Beverley, and Bridlington minsters are still glories of to-day. The castles of York, Bolton, Knarborough, Wressle, Conisbrough, Pontefract, Helmsley, Scarborough, and other relics of troublous times yet look down upon this peaceful nineteenth century. The battlefields of Stamford Bridge, Northallerton, Wakefield, Towton, and Marston Moor still speak of the share Yorkshire

had in making England's history; and grand old York, with its ancient churches and minster, its frowning Bars, and encircling city walls, recalls past fame and grandeur, when the legions garrisoned it as 'Eboracum,' the chief seat of the Roman power in Britain (when London was an insignificant village) long before Saxon and Dane fought in the narrow streets for possession of it as 'Eoforwic.' For the archaeologist, the botanist, the painter, and the sportsman, old 'Eurewieshire' is a happy hunting-ground indeed; the antiquary and philologist alike find it a rich storehouse of quaint customs and strange dialects; whilst to the geologist and physiographer, it is a charming text-book, written in bold graceful language, with many beautiful and wondrous illustrations.

But besides all this, Yorkshire offers vast delights to the explorer and lover of adventure, in the curious subterranean water-courses and awesome caverns which abound in the limestone ranges of the north-west. Less famous than the underground chambers of Derbyshire, they are yet more numerous, and, with two or three exceptions, are utterly free from the desecrating presence of the inveterate 'guide,' who rushes you through them, working unseemly havoc the while with Queen's English, as he waves his tallow candle, and bids attention to the features of the show. It is true that Clapham Cave and Stamp Cross Caverns are regular stock tourist properties, where the lessees give admission and provide illuminants at a fixed charge per head; but he who would see the weird, lonely passages of Ingleborough and Pen-y-ghent must find his own way, and carry a goodly supply of candles with him, for the Great 'Alum Pot' is not a Poole's Cavern which glares bravely when the gas is turned on; and no urchin hastens before to stick torches in the crevices and fissures of Catknot Hole. The real cave-hunter will rejoice at this, and fixing his headquarters at one of the little inns in the neighbourhood, will don his canvas overalls and stiff felt hat, and go forth jubilantly, well stocked with 'dips' and matches, not forgetting luncheon and the cheering pipe.

Of course, if the caves are only to be viewed and peeped into, the 'overalls' are needless; but if a thorough exploration is intended, then, in addition, a stout rope some twelve yards long at least, and two companions, should be taken, for abrupt descents occur which are impassable without a rope and strong arms to hold it.

Ingleborough, with its younger brother Simon Fell, is the central landmark of the great cave district—a district lying between Penygghent and Gragreth, Cam Fell, and the village of Clapham, and measuring roughly nine miles square, which contains all the chief Yorkshire caves and 'pot holes,' with the exception of a group in the limestone at the head of Niddedale—one or two at Settle and Kilnsey, and the famous 'Stump Cross' Cavern, which lies a little off the mountain road running over from Pateley Bridge into Wharfedale. The picturesque village of Ingleton is a pleasant headquarters from which to see Clapham and Yordas Caves; and whence Ingleborough and Whernside may be ascended; but if intent on systematically doing the district, the lonely *Gearstones Inn*, which stands on the moors some seven or eight miles on the road which runs up Chapel-le-dale over to Hawes in Wensleydale, is the best place to put up at. Here, within easy reach, are Douk Caves, long water-worn tunnels piercing the limestone scours which flank the Ingleborough range, wherein is nothing curious except a circular opening like a well, which brings down a beam of light, and gives a glimpse of blue sky thirty feet up through the rock.

Higher up the scours are the curious holes, or 'pots' as they are locally termed, 'Meregill,' Barefootwives, and Hardrawkin. The first is a slit in the ground about forty yards long, ranging from two to nine broad, and bridged now and again by stones and turf; and you can plumb it to a depth of a hundred feet, fifty at least being under water. Hardrawkin is a pot or fissure nine yards deep, which lies between two narrow caves, both of which may be explored, though water often covers the floors. Near the little gabled church of Chapel-le-dale, rendered notable by Southey's *Doctor*, is Wethercote, and its complements Jingle and Hurtlepots, one of the sights of the district. The top of Wethercote is level with the ground, about fifty yards long and sixteen wide, though it narrows towards the ends. Descending fifty feet we come upon a rough arch of rock, and passing under it, are in the middle of the pot, and again descend until the bottom is reached, forty good yards below the surface of the ground. Right in front and eighteen yards above is an opening in the wall of rock; and from it a stream of water leaps in a thundering cascade, filling the pot with spray, and then diving with a shuddering rush into a low cave, disappears on its underground course to Jingle and Hurtle Pots, three hundred yards lower down the dale. The first of these is twenty yards long, and ten to three broad and fifteen deep; and the last, twenty-five yards by fifteen, and about twenty-five deep, with a sullen black pool nine or ten yards deep, from which no outlet is apparent. When the stream is low, it flows far out of sight; but after heavy rain, it can be heard and seen swirling in the dark depths of these pots; and it 'hurtles' out of, and thus gives

name to, the larger of the two. But when the 'floods are out,' the sight is grand and terrible, for then Wethercote fills entirely, and overflowing, foams a torrent down the mossy ravine which scores the land above the unseen water-course below. In the hillside at the back of Gearstones is a winding passage, Catknot Hole, which a guide-book says 'contains romantic cascades and precipices, and is near four hundred yards long.' Three of us struggled again into our thick wet boots one evening, after dining sumptuously in the inn kitchen upon ham and eggs, and having cajoled the buxom hostess into presenting us each with a tallow dip of yellow hue and evil savour, we forded the stream in the darkness, and groped our way into the cavern's mouth to view the said cascades. A stream flowing a foot deep suggested the advisability of doffing boots and stockings in view of a long tramp on the morrow. So, barefooted and with sputtering candles, we began the ascent, and toiled on for fifty minutes, until the dips being nearly used up, and the long passage—which was so narrow that it was difficult to force an onward way—seeming to wind on for ever, the retreat was sounded, and we struggled back, counting nine hundred paces till we reached the entrance, with an ounce of candle among the three. Of 'cascades and precipices' we saw never a sign; but on squeezing past sharp bends, we plentifully plastered ourselves with soft calcareous deposits, which our jackets showed next morning to be strongly impregnated with oxide of iron.

On the slopes of Penygghent are some half-dozen 'pots,' besides numerous openings into the ground, each with a streamlet issuing from or else plunging into it. The whole of this limestone district is, in fact, completely honeycombed by hidden passages and water-worn channels, and often a fall of roof lets daylight and the explorer into the dark passages which pierce the hillsides in all directions. 'Hull' and 'Hunt' Pots are the finest and chief of the Penygghent series; the former a huge quarry-like hole with perpendicular sides, some seventeen yards long by thirty deep, and from ten to thirty wide, into which a stream—or beck, as the local term is—leaps, making in floods a fine fall. Hunt Pot is more curious, and really is a pot in the floor of a pot; the upper one being about thirty yards by eighteen and ten deep, and having in the centre a narrow chasm, five or six yards across at the widest part, narrowing to three at a depth of twelve yards. Into the narrow end, a beck from Penygghent's bold crest falls, filling the black depths with mist, till it reaches the bottom of the pot, sixty-five yards below; and then it flows in darkness, crossing—so tradition says—the stream from Hull Pot, until it issues in the valley as Bransil Beck, and finds its way into the infant river Ribbles.

But the grandest of all these Ingleborough pots and caves, and the one which offers the most risk, and needs withal a steady nerve as well as a fearless heart if it is to be really seen and properly known, is 'Alum Pot,' lying on the north-west shoulder of Simon Fell, a mile above the ruined and deserted village of Selside, whose roofless and crumbling cottages and farmsteads are a fit prelude to the weird loneliness and awesomeness which seem to cling about this

great chain of gloomy caverns. A rough stone wall has been built to protect the main chasm, or Alum Pot proper; and clambering over its jagged edges, we are face to face with a tremendous cleft, which can only be described by the word awful—sixty yards long by from ten to twenty wide. At the southern end, a beck comes sliding over the mossy edge, and then leaps shuddering into unseen depths, whilst a thin cold mist rises up out of the blackness. Across the pot, near the narrow end, are two balks of timber, fixed years ago, when a party of gentlemen descended this shaft; and carefully walking along them, we reach the middle, and look down into the tremendous hole, and see nothing but slimy walls of rock covered with lichens, and here and there great hartstongues hanging in the gloom, and waving in a chill up-current of air which blows stealthily from the sunless depths. The first impression is one of nameless dread and shrinking, an effect only heightened when a large stone is dropped into the yawning gulf, and we strain ears for six long seconds before it strikes at all; and then, for several moments after, hear it falling still, rebounding lower and lower in unknown abysses beneath the plank which holds us up. After gazing steadily downwards until the eye becomes used to the chill gloom, we catch sight of a sloping dark-green plain far below, from which a stone will roll into deeper depths beneath, and see, some thirty yards down the northern side, a huge dark arch, which ends a passage coming in from the hillside.

Without a very long stout rope, it is impossible to descend Alum Pot from the bridge-balks; and to swing freely over a visible gulf which is in all three hundred yards deep is a stiff trial for ordinary nerves. So, receding the wall, we climb some hundred and fifty yards westward up the hillside, until we come upon several openings in the ground known collectively as Longchurn and Diccan Pots. Dropping into the hollow, we see two passages leading in different directions, and can hear in the hushen distance the roar of water on its way to Alum Pot. About ten yards down, the lower passage joins one in which a stream is foaming; and a piece of burning magnesium ribbon lights up a goodly cavern, and shows a small cascade seven or eight feet high which glistens milk-white in the brightness; and plunging into the cold waters hurrying onwards, we follow them in their winding channel, often down abrupt descents and tiny falls, for, say, sixty yards or more, until a roomier passage strikes off to the right. The stream flows straight on for some score yards, and then joins one which flows at right angles on a lower level, coming from a more westerly direction. If wading be a weakness, this route may be followed; but as underground becks are decidedly cold, even in July, the drier and loftier channel offers decided advantages. After many windings and one or two steep drops, passing lesser openings which branch off on either hand, a large and lofty chamber is reached, studded with rough rocks, terminating in a black and apparently bottomless abyss, across which a gleam of twilight struggles in from the Great Alum Pot through the arch, which is seen when looking down from the bridge. This gulf is about thirty-six yards

deep, and is curiously divided down the middle by a long thin rock, which is reached after a descent of some ten or twelve yards, and affords a precarious resting-place before descending the other fifteen yards, which brings us to the mossy sloping rock visible from the top of the pot, and which crosses it at the northern end. About thirty yards along this is a break where a rock slopes down to a lower level, and forms a bridge over a depth of at least thirty-five yards; but past this, the way is easy to the south end, where the waterfall comes down from the edge of the pot, seventy yards above, to fall still twenty yards before it strikes the rocks. Descending to this level, a series of steps down yet six or seven yards leads to two further falls of some thirty and ten feet each, and then the water goes onward along a passage and disappears in darkness.

The great descent of Alum Pot was made many years ago, when the balks of timber already mentioned were thrown across at the top by several gentlemen in the neighbourhood, and the engineers who were constructing a line of railway near Settle. Upon the bridge thus formed a winch was fixed, and the explorers were let down in a bucket, two at a time, plumb seventy yards to the rocks where the waterfall strikes, thus avoiding the long tiring descent of the passage from Longchurn. The last fifty feet gave each bucket-load a drenching, for it brought them directly under the falling water—a very effective douche-bath. Leaving the pot, they followed the stream for forty yards down the passage until they came into a lofty cavern where was a waterfall forty feet in height, formed by another subterranean streamlet; and passing through this, and continuing for thirty yards further, they reached a circular hole where the water sank in a miniature whirlpool; and that was the end of the mysterious Alum Pot. Where the water goes to, is uncertain; it is said to flow under Scidside village, and come to light again either in a muddy pot called Footnaws, twelve yards deep; or else to pass under the bed of the Ribbles, and reappear in Turn Dub, a quiet pool ten yards across, out of which a goodly stream flows steadily into the river. One reason why the country-people hold Turn Dub to be the outlet is that, when a marble quarry which lies just above Longchurn Pot was being worked, the water in the Dub was milky and muddy like the stream which flowed into Alum Pot.

The next most curious group of caverns lies out of the Ingleborough district altogether, at the head of Nidderdale, about the hamlets of Middlesmoor and Lofthouse, where comfortable quarters may be had in their unpretentious inns. On Howsteanebeck, which comes down a romantic gorge, are several chambers easy of access; and in a field on the Middlesmoor side is an opening which leads into a long underground passage known as Eglins' Hole, of unknown extent. The roof is in many parts so low that crawling is an absolute necessity; and as the floor is often covered with soft mud, and there is nothing particular to see, no large chambers or curious formations, the time required for this tunnel may be far more advantageously spent in exploring the most famous and interesting cavern of all,

'Goyden Pot,' which lies two miles above Loft-house, close to the farmstead of Limley, and which carries the river Nidd mysteriously underground to below Lofthouse Church. The mouth of this misnamed 'pot' is at the foot of a cliff seven or eight yards high, on the honlder-filled bed of what was the river before it broke its way into the hillside, and which is swept by a noisy torrent still in heavy floods, when the waters fill the cavern to overflowing. A passage varying in height from two to five yards and about one hundred yards long, with offshoots running right and left, leads, after several descending turns, into a huge chamber, filled with the roar and unseen spray of falling waters; and magnesium ribbon reveals a weird and frightful scene—a deep abyss in front and below, a dome of blackness overhead, on the left a plunging cascade of flashing water, twenty feet at least in height. Opposite and across the yawning gulf, a dark archway marks where a passage leads higher up into the mountain; whilst to right, the stream still foaming after its leap, gurgles and rushes round a bend into a lower pitch-dark tunnel. In dry weather, a descent can be made by the aid of a rope down the side of the chasm, and the stream can be followed often waist-high for a long distance. No one, in the memory of living man, has succeeded in following the water into daylight; but it certainly has yet to be proved that it cannot be done, and though twice baffled, we only wait a favourable opportunity to make another determined attempt. Long settled dry weather is absolutely necessary, as, owing to the steepness of the sides of the narrow valley, a single thunder-shower will raise the level of the river several feet in half an hour; and the tree-roots and other massive debris which are plentifully wedged in the crevices of the roof of the cavern are sufficient evidence of the undrability of being caught by the tide, so to speak, in Goyden Pot.

Such are some of the Yorkshire caves; and those fond of adventure and rough healthy scrambling will find many a day's enjoyment therein, and spend, moreover, many a pleasant hour amongst the sturdy dulesmen, hearing quaint country legends, told in a dialect homely and rough, and seeing something of what life is like unaffected by the hurry of the great world outside the hills around. But let not the fastidious venture in those wilds, for ham and eggs—eggs and ham—become monotonous when doing duty daily for breakfast, luncheon, dinner; and though hospitable and open-hearted enough, yet the dalesfolk look upon all, even Yorkshiremen who are not natives, as 'furners.'

BY ORDER OF THE LEAGUE.

CHAPTER VII.

It was a little after five on the following afternoon that Sir Geoffrey walked from his house into the square. He seemed, by his uneasy air, as if he was afraid of having his movements watched, for he stopped, hesitated, and finally walked away quickly in the direction of Upper Brook Street. Calling a hansom, he was driven to one of the quiet approaches, half town, half

country, beyond Paddington, where he dismissed his cab. He then walked quickly on till he reached his destination—a well-appointed though sombre-looking establishment; and there, after some hesitation, he knocked. The room he was shown into was laid out with preparations for dinner; and just as the little clock over the mantel struck the half-hour after six, Lo Gautier entered. He greeted his guest quietly, almost coldly, and rang the bell to order the meal. It was a quiet little dinner, really irreproachable in its way—the appropriate wines being perfect, for Lo Gautier by no means despised the pleasures of the table, and, moreover, was not the man to spare where he had a purpose to serve.

'Well, Sir Geoffrey,' he said, toying with his glass, when the meal had concluded—it was past eight now, and the light was beginning to fail—'do you feel equal to the coming trial?'

'O yes,' the baronet replied eagerly, though his face was perturbed and the glass in his hand shook. 'Let us get it over; this suspense is killing me. Sometimes I fancy you are playing some devilish arts upon me. I doubt the evidence of my senses.'

'You do not doubt,' Lo Gautier answered sternly. 'Listen!'

The light in the room was fading, and nothing distinctly could be seen save the glimmer of the waning day upon glass and silver. At the moment, the strains of music were heard, low and soft at first, then swelling louder, but always melancholy. It was quite impossible to tell whence it came—it seemed to strike the ear as if the earth was full of the sweet sounds. Suddenly it ceased, and a sigh like a mournful wind broke the stillness.

'It might be my dead brother himself playing,' Sir Geoffrey said, in great agitation. 'The organ was his favourite instrument. Strange that the music should be so familiar to me!'

'Do you doubt now?' Lo Gautier asked. 'Does your unbelieving mind still run upon trickery or mechanism, or are you convinced?'

'I must believe,' the weak old man replied; 'I have no alternative. I put myself in your hands. Tell me what I am to do.'

'Your own conscience must guide you, and what the spirits will to-night must be obeyed. It is no question for me to decide; I am merely the humble instrument, the medium between one world and another. I dare not advise you. When your nerves are sufficiently braced to meet the dead, I will restore the communication.—Are you afraid?'

'No, no!' cried the baronet; 'I am not afraid.'

A cold, icy hand touched him on the cheek, and a low voice whispered in his ear the words: 'You are!' Trembling, frightened, he rose from his chair; and then suddenly the room was filled with a great light, showing the baronet's set face, and Lo Gautier's pallid features wearing a sardonic smile. Hardly had the light appeared, when it was gone, leaving the room in double darkness at the change. A yell of harsh, discordant laughter rang out, dying away to a moan.

'What is that, Lo Gautier?' Sir Geoffrey asked.

'Is this all real, or am I merely dreaming?'

'The spirits laugh at your audacity. You

boasted you were not afraid, whilst you are trembling in every limb. You dare not say it again !'

'I am alarmed, mystified,' he said ; 'but I am not afraid.'

A mocking shout of laughter followed this speech, and the words, 'You lie !' as if uttered in chorus, were distinctly heard. A cold hand clutched Sir Geoffrey by the throat, holding him till he could hardly breathe. In his intense agitation, he snatched at a shadowy arm, and suddenly the hand relaxed its grip. Le Gautier struck a match and lighted the candles.

'Are you afraid now ?' he asked quietly.

'O yes, yes ; anything to save me from that horrid grasp ! My throat is aching with the pressure.'

Le Gautier looked at the finger-marks calmly. He was acting splendidly, not overdoing the affair in the slightest, and, on the other hand, not appearing altogether indifferent. He was playing for a high stake, and it required all his cunning, all his cool audacity, to win. To the casual observer, he might have been an enthusiastic believer.

'You have seen enough,' he commenced quietly, but with an air of the most profound conviction—'you have seen enough to know that the time for delay is past, and the hour for action has arrived. The spirits to-night are incensed with you ; they are furious at this delay ; and unless you solemnly promise to carry out my proposals, I shall not risk our lives by any manifestation to-night.'

'What am I to do ?' Sir Geoffrey cried piteously. 'I put myself entirely in your hands. Tell me my duty, and I promise to follow it.'

'So much the better for you,' quoth Le Gautier sternly. 'Listen ! You know I am a member of a great Secret Society. In the first place, you must join that ; and let me tell you, your late brother was a member, and took the keenest interest in its movements. You must join !'

'I knew my brother was embroiled in some rascally Socialist plots,' said Sir Geoffrey incautiously ; 'but I really do not see why I'—He stopped abruptly, for the same mournful sigh was heard, and a voice whispered in the air, 'Beware !' With increased agitation, he continued : 'If that is part of my penance, I must do so ; though it is on the strict understanding that I'—

'It is on no understanding at all !' Le Gautier thundered. 'Who are you, poor mortal, that you should make stipulations ? We must have all or nothing. Take it, or leave it !'

He looked straight across into the other's face, his eyes burning with their intensity. For a moment they sat thus, striving for the mastery. Then Sir Geoffrey looked away. He was conquered.

'Let it be so,' he said. 'Your will has conquered mine. Proceed, for I see you have something more yet to say.'

Again the sigh was heard, and a voice said distinctly : 'It is well.' The music burst out again triumphant this time. When the last pealing strains died away, Le Gautier continued : 'Your brother died at New York, as you know ; but at that time, he was on the business of the Society. No man had his heart so firmly set upon the cause as he, no man has been so missed. You would never be able to take his place ; but

you can help us indirectly ; you can aid us with what we most need, and that is money. You shall see the shade of Sir Ughtred presently, and hold converse with him ; but, on the peril of your life, do not move from the spot where I shall place you.'

'Let us go now,' Sir Geoffrey cried eagerly. 'Why should we waste any more time talking here ?'

'Because things are not prepared. The shades from another world do not come forth at a moment's bidding to show themselves to mortal eyes, though the air is full of them now.'

Sir Geoffrey looked uneasily around for any traces of these ghostly visitors, though he could see nothing ; nevertheless, the idea of a chamber full of supernatural bodies was by no means pleasant.

'Then our pact is complete,' Le Gautier continued. 'Briefly, it stands thus : I am to show you such things as you wish to see ; and in return, you become a member of our Brotherhood, swearing to promote its welfare by all the means in your power. Quick ! say the word, for I feel the unseen influence upon me.'

'Yes, yes—agreed ; only show me my brother.'

As Sir Geoffrey spoke, a change came over Le Gautier's face ; the baronet watching him, perfectly fascinated. The medium's eyes grew larger and more luminous, his features became rigid, and he moved like a man who walks in a dream. His gaze was fixed upon the other, but there was no sense of recognition there—all was blank and motionless. He rose from his chair, moving towards the door, his hands groping for it like the action of the blind, and he beckoned to Sir Geoffrey to follow him out along the dark passage.

'Come !' he said in a strange hollow voice—'come with me ! The spirits are abroad, and have need of me !'

The room they entered was situated at the back of the house, having a large old-fashioned bay window of the shape and form one sees in the banqueting-room of old country-houses—a long narrow room, draped entirely in black ; and the only light in the place proceeded from two small oil-lamps held by white Parian statues. As the twain entered, the draperies were violently agitated, as if by a sudden wind ; an icy current seemed to strike them full in the face. A chair, impelled forward by an unseen hand, was pushed across the bare floor, and Sir Geoffrey, at a motion from his companion, seated himself therein. Le Gautier stepped forward towards the window, and lighted a flat brassie, sprinkling some sort of powder upon it, and immediately the room was filled with a dense violet mist, through which the oil-lamps shone dimly. The weird music commenced again, and as it died away, a loud report was heard, and the curtains across the window were wrenched apart, disclosing an open space. As Sir Geoffrey gazed into it, a form began to appear, misty at first, then getting gradually clearer, till the watcher saw the figure of a girl, dim and slight, for he could see the woodwork of the window behind, but clear enough to see she was fair and young, with thick masses of long yellow hair hanging over her shoulders, and half hiding her face from sight. There was a look of sadness on the brow.

'You may speak,' the strange hollow tones of Le Gautier came through the mist. 'If you have any questions to ask, put them; but, at the peril of your life, do not attempt to move.'

With the most reverent and holy belief in the reality of the scene before him, Sir Geoffrey gazed at the downcast features. To his diseased mind, he was on the borderland of another world, and the very thought of speaking to the bright vision was full of awe.

'Who are you?' he said at length in tremulous tones. 'Let me know who it is with whom I speak.'

'I am your better self,' the vision spoke; and the voice sounded faint and distant, yet very sweet, like music on the waters. 'I am your good spirit, your guardian angel. I stand by you night and day, the presiding deity of the honour of the House of Charteris.'

This artful stroke gave the listener confidence, and flattered his family pride. 'Has every man a spirit such as you?' he asked.

'Every man who is by nature noble—yes. To every one who has courage and genius, one of my sisters belongs. I am the guiding star of your House. I have stood by you and yours in the hour of need. I saw your father die. I saw your brother's deathbed. It is of him you would speak?'

'It is,' the baronet cried boldly. 'What of him?'

'You owe him a heavy debt of reparation,' the vision continued sadly. 'In life, you were not always friends; in death, you were not with him. He left a family. Are you aware of that, selfish mortal?'

'I did not know; I never knew. But it is not yet too late to atone. Tell me where they are, and I will go to them.'

'It is too late!' the figure replied in tones of deepest sorrow. 'They are dead—dead of neglect; nay, more, starvation. They will not dispute your sway now. While you had flattery and adulation, while you lived in luxury and splendour, your kith and kin lacked bread.'

'But surely some atonement can be made?'

'Too late—too late! Nothing can avail them now, no specious sophistry, no outward appearance of remorse. You can atone, though slightly, by completing the work your brother began in life. Know that at your very door, proud man, thousands of your fellow-creatures are starving, ground down in the dust by injustice and oppression. You can help to lighten this burden; you can help these men, who, poor and savage as they are, are yet men, and brothers.'

'I will!' Sir Geoffrey cried eagerly. 'I will! Only show me how; and let me see my brother, if only for a brief moment.'

'That is well,' the figure replied with a radiant smile. 'As for the means, I must leave that to you. But you shall see your brother, if only for a moment.—And now, farewell.'

'But stay another minute. I'—

The farewell was repeated, coming to the listener's ears as from afar off, fainter and fainter, as the violet mist rose again, filling the room with a dense fragrant smoke, through which the rigid figure of Le Gautier could be dimly seen erect and motionless.

When the mist cleared away again, the figure

of a man grew visible. Perfect, yet intangible, he stood there, muffled in a long cloak, and his features partially hidden by a soft broad-brimmed hat. At this spectacle, Sir Geoffrey's agitation increased, and great drops stood upon his forehead.

'It is he—my brother!' he groaned, starting from his feet; but again the word 'Beware!' seemed to be hissed in his ear. 'My dear brother, do not look at me like that. It was no fault of mine, I swear.'

The figure answered not, but looking the wretched man in the face, pointed down to his feet, where two thin, emaciated children crouched; evidently in the last stage of disease and starvation.

'What atonement can you make for this?' was asked in the stern tones the listener knew so well. 'Man! in the enjoyment of what should, under happier auspices, have been mine, what do you say to this?' He pointed down to the crouching children again, sternly yet sadly.

'Anything,' the baronet exclaimed.—'anything, so that you do not torture me like this! It is no fault of mine. I did not know. But anything in my power I will do, and do gladly.'

'Well for you that you have spoken thus! You shall complete the work I began in life, and the man called Hector le Gautier shall help you with his aid and counsel.—You have a daughter?'

'I have—your niece Enid. What do you know of her?'

'Much; perhaps more than you.—Listen! and interrupt me at your peril. You may have views for her; perhaps she has chosen for herself. Am I right? But this must not be! Hector le Gautier must wed her!'

'But I have other views. There is already'—
'Do you dare to cross me?' the vision sternly asked. 'Have not I and mine suffered enough at your hands? Promise, or'—

He stopped abruptly, and again the sighing voice whispered 'Beware!' In an agony of terror, the baronet looked round; but the dark eyes never seemed to leave him. So frightened was he, so stricken by this cunningly devised display, that he dared not defy the figure standing there before him.

'I promise,' he shouted at last.—'I promise.'

'Tis well,' the vision said. 'From this moment, you are free. You will soo me no more; but if you dare swerve a hairbreadth from our compact, then you shall find my vengeance swift and terrible. Geoffrey, farewell!'

'But, Ughtrid; one moment more—I'—

A deep shuddering sigh broke the silence, and the figure was gone. Almost distracted, Sir Geoffrey rushed forward to the curtains, which had again fallen, but nothing was there. The smoke cleared away, and once again the room was quiet.

Le Gautier opened his eyes, and gradually life and motion came back to him, as he awoke like a man from a trance. 'Are you satisfied,' he asked, 'with what you have seen?'

'Wonderful!' the trembling baronet replied. 'It was my brother to the life—the very voice even. You heard the compact?'

'I, my dear Sir Geoffrey? No, indeed,' Le

Gautier exclaimed in a voice of great surprise. 'Recollect, I heard nothing; my faculties were torpid; they formed the medium through which sights and sounds were conveyed to you.'

'And you heard absolutely nothing?'

'Absolutely nothing.—But, of course, if there happened to be anything which concerned me, you can tell me at your convenience.—And now, I think we have had enough of spirits for one night, unless you would like something to steady your nerves!'

Sir Geoffrey declined the proffered refreshment, pleading the lateness of the hour and his desire to get home. Le Gautier did not detain him; and after a few words, they parted; the one to dwell upon the startling events of the evening, and the other to complete his plans. It was a neat stroke of Le Gautier's to disclaim any knowledge of the conversation, the rather that the delicate allusion to his relations with Enid were mentioned, and besides which, it acquitted him from any awkward confidences.

'The game is in my hands,' the schemer mused an hour later, as he sat over his last cigar. 'Would any one believe that a man of education, I almost said sense, could be such a fool?—Necior, *mon ami*, you will never starve as long as there is a Charteris in the world. The opportunity has long been coming, but the prize is mine at last; and with these words, the virtuous young man went to bed, nothing in his dreams telling him that his destruction was only a question of time, and that his life was in the hands of two vengeful women.

KENTISH HOPS.

THE country can show few prettier pictures than a hop-garden in a sunny August. The vines twine vigorously round the rustic poles, while the side-shoots hang down in graceful festoons or from pole to pole in tasteful wreaths. Rich clusters of burr hanging from every joint bend down the slender tendrils, until it seems that every moment they must break; and but for tying and stringing, break they often would. But if the graceful plants are picturesque in themselves, it is when viewed as a whole that the hop-garden has its greatest charm. Stretching away in endless succession, until lost in the narrowed distance, is bower upon bower, in which Robin Goodfellow and all his merry crew would be at home. Everywhere there is a wanton luxuriance which seems to belong to nature rather than to industry. The artificial stiffness of the long lines of poles is hidden by their wealth of greenery. In many gardens, too, the hops are still planted in the good old-fashioned style—in groups of three on 'hills'—festooned in irregular triangles, each of them a verdant arbour. Through the masses of foliage, the sunshine gleams merrily, lighting up the bright yellow catkins, and creating a thousand contrasts of light and shade. The pungent sweetness of the air gives an added charm to the picture, which appeals to the several senses with a rare witchery. We have little need, while we have our hop-gardens, to envy the vineyards of

more sunny climes; and it may be a national prejudice, but we take leave to doubt whether in point of the picturesque they do not bear the palm. But the comparison is superfluous.

We, as a nation, are proud of our hop-growing counties. We point triumphantly to the 'fruit,' which is, or ought to be, the staple of our national beverage. In one respect, however, the culture of the hop easily resembles that of the grape. Both are terribly bazarious. Not even the dreaded phylloxera is more devastating than the red spider. The oidium is not more deadly than mould, and both diseases, curiously, require to be treated by sulphuring. Hops, like vines, are subject to plagues of vermin. The hop-fly is a terrible pest, and when, as often happens, it attacks the vines at the same time as mildew, the case is almost hopeless, for sulphuring cannot be employed. According to the popular theory, sulphur, although it revives the blighted vines, makes the fly more vigorous; so that, as the fresh crop rises, it effects such a lodgment in the plant that recovery becomes hopeless. No more dismal spectacle can be imagined than a blighted hop plantation. The blackened vines cling listlessly to the poles. Here and there, a few young but sickly shoots give proof of a vain effort to throw off the pestilence, which seems to threaten the very existence of the parent stem.

Hop-culture, indeed, has manifold dangers in our treacherous climate. In dry seasons, the crop is often so light as hardly to pay for the picking; while, unless there be sunshine and to spare, and, above all, a long spell of warm nights, the burr hardly ripens, and the hops cannot be got in anything like condition. It is not perhaps generally known that although this is a special branch of agriculture, and calls for a high degree of skill and care, there are many varieties of hops which are suited to many different soils, and will thrive under different conditions. It is a common saying in hop counties that one good crop every seven years will pay; so that it may well be asked whether, notwithstanding the risk, a much greater area could not be advantageously put under hops in England? Our soils and in situations where the famous 'Goldings' or 'Whitelines' will not do well, 'Grapes' often thrive. Then a kind known by the familiar name of 'Jones's' have long been profitably grown on light and poor land; and on stiff soils, 'Collegates,' a late and very hardy variety, have done well. Flemish red vines, too, although an inferior sort, often succeed in bad years, since they are less susceptible to blight. So there is plenty of choice for agriculturists.

There is good reason for believing that hops were known to the Anglo-Saxons, whether or not they introduced them into Britain; for the name is admittedly derived from the Anglo-Saxon *hoppa*, 'to climb.' There is, however, a distich:

Turkey, carps, hoppers, pickard, and beer,
Came into England all in one year—

whence has arisen the notion that the plant was

not known in this kingdom until the time of Henry VIII. But although the method of cultivating the plant in vogue in the Low Countries may then have been first introduced into England, as early as the year 1428 Parliament was petitioned against the hop as a 'wicked weed,' showing that it was then coming into use. It was not, however, until a century later that it became a general ingredient in the manufacture of malt liquors, and it was long chiefly imported; for the plant was not extensively cultivated with us until the beginning of the seventeenth century. The city of London did not look with favour upon the new industry, for they petitioned the Long Parliament against 'two nuisances or offensive commodities which were likely to come into great use and esteem; and that was Newcastle coal in regard of their stench, and hops in regard that they would spoil the taste of drink and endanger the people.' The petition, however, does not seem to have met with very great success, for both industries soon increased to prodigious proportions. Hops were presently taxed, and became a source of considerable revenue.

Kent was always the chosen hop county. Some seventy thousand acres are now under this crop, and of these, forty thousand are in Kent alone. Farnham is the centre of the hop district of Surrey. Then parts of Hants and Sussex, Essex and Suffolk, Hereford and Worcester, and even so far north as Notts, have long been cropped with hops; and although success has been checkered with failure, the returns as a whole have proved fairly remunerative. The yield is, of course, very variable, ranging from eight to ten hundredweight per acre in a good season, the heaviest crop on record being twenty-five hundredweight, to five and even three or less in a bad one. The prices realised, too, depend so much upon condition and quality that it is only possible to give here the slightest indication. As much as twenty-five pounds per hundredweight has been paid for the first 'pockets' on sale in the Borough; but this is, of course, a phenomenal price. Owing to the immense quantities of foreign hops in the market, prices in an ordinary year seldom rule higher, for all but the very finest sorts, than from nine to thirteen pounds per hundredweight. But although hop cultivation is steadily on the increase in England, it by no means keeps pace with the import trade. Every year we import many hundred thousand hundredweight, of which about half comes from the United States, and the remainder from Australia, Belgium, France, Wurtemberg, Central Germany, and Holland. Against this we export only a few thousand hundredweight to India and some of the colonies.

From all this, it will be seen that there is room for a considerable increase in the land under hop cultivation in this country. Nor, if the culture of the plant be strictly subordinated to that of other crops, need the risk be prohibitive. Moreover, a variety of uses have lately been introduced for the waste of the crop. Little, for instance, has hitherto been made out of the hines in this country; but within the last few years they have been experimentally converted into ensilage and found to form at once a valuable feeding material and a useful tonic. Other uses have been found

for them abroad. Thus, in Sweden, they have long been treated so that they could be woven into a rough kind of cloth. The process was formerly very tedious, consisting chiefly of soaking them in water all the winter; but it has been greatly expedited by treating them successively with alkaline lye and acetic acid, when the fibre is at once ready for leaching. This use for hop-bine has, however, for some unknown reason, never attracted much attention in Great Britain. An English patent was once taken out for using the plant for tanning purposes; but, so far as we know, it has never been very successfully used; and the hine is still to a large extent regarded as a waste product, or at best used as litter.

GEORGE HANNAY'S LOVE AFFAIR.

CHAPTER III.—SUCCESS AT LAST.

ALFRED ROBERTSON was too politic to make known the full extent of his discomfiture. He made light of the matter: most authors had had their difficulties—at first, and why should he expect to escape? He made himself very agreeable to the old gentleman. The short experience he had had of trying to earn money had led him to reflect that a man having a snug going business and a farm worth four or five thousand pounds might not be such an undesirable father-in-law after all, even though he was an innkeeper. He threw greater fervour than ever into his manner towards Anne, and talked in a gay and hopeful way of the future. But she was too keen-sighted to be deceived; she read the secret of his crushed hopes in his sunken eyes and cheeks, and was not at all misled by his forced cheerfulness of manner. She forbore to annoy him with prying questions, and affected in the meantime to see as roscate a prospect as he himself did. When the colour came back to his cheeks and he began to look more like his former self, she spoke to him seriously. Would he allow her to see the returned manuscripts?

'You know, Alfred,' she said, 'I have been a great reader of what is called "light literature" in my day, and perhaps I might—from a reader's point of view, you know—happen to light on the secret of your want of success. Give me two or three of your stories, and I will have a look at them before I go to bed to-night.'

He was astonished! To think of this simple country girl proposing to criticise his literary work!

'Well, Nan, I'll select two or three of my best,' he said; 'but I fear you will prove far too indulgent a critic to be a just one.'

'No, Alfred,' the girl replied gravely; 'you need not fear that. You may depend that any faults that I may perceive will be carefully pointed out to you. Don't look for any kid-glove treatment at my hands; and he prepared, in any case, to keep your temper.'

The next morning, after breakfast, she handed him his papers back. He could not possibly

guess from her countenance what her impression had been. Her face had an earnest, but not an altogether unhelpful look about it; certainly, it did not show any signs at all of a wondering admiration for his genius.

'Well, sir, I've read your stories, as I promised I would. I will say all my disagreeable things about them first. To begin: I think they lack the narrative power which leads a reader on, once he has commenced a story, and almost compels him to read it to the finish. Of course he is disappointed at the denouement; but he is equally ready to be cheated again by the next book he takes up, provided the author has the same power to lure him on. I think the first aim of a magazine writer should be to make his stories readable.'

'And are not mine readable?' he said, biting his lips and a frown overshadowing his brow.

'Ah, I see you are wincing, Alfred! But didn't I warn you I would be a severe critic? No; I did not say your stories were *not* readable; but they might be made much more so.'

And to his amazement, this young girl launched into a critical analysis of the plots, characters, and treatment of his three stories; and her remarks, strange to say, pretty closely agreed with those expressed by the ignorant London editors! Nan had verily profited by her old lover's literary conversations; but Alfred knew nothing at all of that. She was then graciously pleased to say a few words of commendation.

'Your style of composition is far too even for that sort of work. It lacks eccentricity!'

'Pardon, Nan!' he interrupted; 'but are you serious? I have hitherto understood eccentricity was considered a bluish in any author's style.'

'Nonsense!' she said. 'If not overdone, it lends a piquancy to writings that without it would attract no attention and be passed by as prosy. When an author happens to hit on a good original phrase, he should "ring the changes" on it. The reader recognises it as an old friend met under new circumstances, and is not at all displeased. An author who can originate a few phrases, put them in his mental kaleidoscope, so to speak, and sprinkle the resulting combinations through his book, is said to have acquired "a style," and his books are sought after.'

'By Jove, Nan, but you surprise me!' he cried, looking at her with a puzzled air. 'What, then, would you advise me to do?'

She was prepared for this question, and had been framing an answer to it in her mind for some days past. Obviously, the most sensible advice was for him to abandon his literary dreams, and settle down to the pursuit of his profession. But then sensible advice is rarely palatable, and still more rarely adopted. That he was determined to make a mark of some kind in literature, was evident, and she rather admired her lover's indomitable pluck, in refusing to accept as final the unfavourable criticisms of London editors. If he hadn't been her lover, she would probably have called it 'stupid obstinacy.' She therefore determined to urge him on in his literary projects; he was undoubtedly

clever, and was certain, sooner or later, to see his productions in print. When he reached that goal, the glamour which possessed him would probably vanish; and he would then most likely return to his profession, as a surer road to success and distinction.

'Did you ever try the *Olympic*, Alfred?' she said.

'O no,' he rejoined. 'You see, it is more of a review. Besides, it is a very high-class, exclusive magazine, and one not at all likely to encourage beginners like me.'

'I know they don't publish stories,' continued Nan; 'but they have often short descriptive articles. Now, I was thinking if you were to send the editor a short sketch of some kind in your very best style, he might perhaps put it in.'

'And what kind of sketch would you propose?' he inquired.

'What would you think of "A Summer Ramble in Kirkcudbright?"' she replied. 'The editor belongs to that quarter; and if the description of the scenery and folks were well done, I think he might put it in.'

'A capital idea, Nan. Why, I'll set about it at once,' he said impetuously.

Alfred went to work with renewed hope and vigour. After ten days' alternate rambling and writing, he one evening announced that his paper was finished, and read it over to Nan in the parlour. On the whole she gave a favourable verdict on its merits; and it was sealed up and duly addressed to the editor of the *Olympic*. She had insisted on him using a *nom de plume*. He chose that of 'Ariel'; and the address was: 'Post-office, Glenluce.—To lie till called for.'

The evening passed pleasantly in chat and song; and when Nan rose to bid good-bye for the night, she said: 'By-the-bye, Alfred, you had better give me your letter with the manuscript. I will see the postman as he passes in the morning, and hand it to him.'

'Nonsense, Nan!' he returned. 'Why, the mail-gig passes before six o'clock. There's no use in disturbing you so early. I will hand it to him myself.'

She was inexorable in her request, however, and ended the dispute by playfully seizing the letter, and tripping up-stairs before he could prevent her. Once in the privacy of her own room, a strange change came over her. With knitted brows and compressed lips, she slowly paced the apartment. Evidently, she was making up her mind on some important resolve. At last she clasped her hands and whispered to herself: 'Yes; I'll do it—but is it fair?'

She had a tired and drowsy look next day; and when Alfred asked if she had been in time to give the postman the all-important letter, she answered somewhat petulantly in the affirmative. After a time he took to walking to Glenluce 'jolly' to see if there were any letters for 'Ariel.' For ten days he came back empty-handed and dispirited; on the eleventh he bounced into Nan's private parlour in a state of wild delight.

'I knew it—I was sure of it, Nan!' he cried, 'that the moment my writings came before a competent judge they would be fully appreciated. Look! here is a bank draft for twenty pounds. It only took me ten days to write the sketch.

Why, it is payment at the rate of six hundred a year!

'Was there a note with it?' she asked quietly.

'Yes; a precious short one, though.' 'The editor of the *Olympic* acknowledges receipt of Ariel's manuscript, which he accepts, and begs to inclose bank draft for twenty pounds as an honorarium.' 'That is all.'

'The editor has remunerated you very handsomely, I think,' she said, continuing her sewing. 'But mind that one swallow does not make a summer. Don't be too sanguine. Other editors may not be so generous to you.'

'Stuff!' he replied loftily. 'Do you mean to say he would have sent so much unless he knew he had got value, good value for it too? Do you know, Nan, I made up my mind, after getting the letter, to start for London to-morrow? I'll call on the editor of the *Olympic*—perhaps he may.'

'On no account must you do that, Alfred!' she cried, dropping her sewing, and with a terrified look in her face. 'Go to London, if you think proper; though I think you would be foolishly expending money in doing so. But you mustn't call on the editor.'

'And why mustn't I call on him?' he said in a displeased tone of voice.

'I have reasons—private reasons of my own, Alfred, to wish you to refrain from doing so,' she replied a little awkwardly. 'I cannot explain them to you just yet; perhaps I may again. Meantime, you must promise me solemnly not to call on him, or send him any more contributions, unless you choose to do so in your own name.' 'On no account must he be made aware that you are "Ariel." Remember, it was through my advice you scored this first success; continue to follow it, for I can assure you it is for your own good.'

He grumbled a good deal, but in the end agreed to the restriction imposed on him. He held firm, however, to his intention of going to London; and Anne did not press her objections further. He could not understand why she was not more elated at this auspicious beginning of his literary career. In fact, he fancied he saw a pained expression passing over her countenance, when, in the exuberance of his spirits, he enlarged on the brilliancy of his prospects in the metropolis. Somehow or another, the success of 'A Summer Ramble in Kirkcudbright' detracted from rather than added to the happiness of the lovers. The slightest possible degree of coldness sprang up between them. He was annoyed, and even felt some distrust at the prohibition put on him regarding the *Olympic*. That Nan was annoyed at something, was apparent; but whether it was his anxiety to leave her and be off to the scene of his future triumphs, or what it was, was not very apparent. The only one who enjoyed unalloyed satisfaction from the event was old Mr Porteous. The bank draft convinced him more than a thousand arguments that there was money in literature, and that his proposed son-in-law possessed the Open Sesame to its stores. He had far too high an opinion of his old friend the editor's sense than to suppose he would have given twenty pounds for a short sketch unless it was of real merit. These reflections made him a trifle more cordial

to Alfred than he had yet been; and when he and Nan drove him to the railway station, they all parted the best of friends, the lovers promising to correspond punctually as before.

A HUMBLE SPRIG OF NOBILITY.

A RED RIVER STORY.

TOWARDS the close of the last century, Mr Beauchamp, a young Englishman of good family—a friend of Pitt, Fox, Burke, and Sheridan—entered a large mercantile house in London with a view, it was supposed, of ultimately becoming a partner therein. With this firm he passed the earlier years of his manhood. With the single exception of having lost both his parents in his youth, he was regarded as a singularly fortunate individual; and at the age of nineteen he formed a matrimonial engagement with Julia Middleton, a young lady of considerable prospective wealth, and of remarkable personal attractions. But just at the time when an announcement of the marriage was expected by the friends on both sides, Mr Beauchamp disappeared in a mysterious manner; and neither the parents nor Miss Middleton had any explanation of the cause of his disappearance, or whether he had gone. It was, however, but a nine days' wonder; and all minds, but one, ceased to trouble themselves further about the matter. That one was the poor girl herself, who was deeply attached to her lover. Whenever any hint was thrown out which cast a doubt over the moral rectitude of Henry Beauchamp's character, she indignantly repudiated the idea, and would believe no evil concerning him that originated in mere conjecture on the part of the speaker.

It must be borne in mind that at the period of which we are writing, international communication was not carried on with the same speed and facility as in these days, and a considerable time elapsed ere it became known that Henry Beauchamp had embarked for Canada. But of his real whereabouts nothing was known for years. The facts we are about to record were divulged to us by a lady to whom we shall hereafter refer. He had, it appeared, entered into business with a Fur Trading Company, and with them he passed many years in a country called 'The Kepingong,' between Lake Superior and James Bay. Half a century ago, traders were often men of low type, who led lax and vicious lives. As ill-luck would have it, it was amongst such a class that the young adventurer chanced to fall. Out in that wild territory, with no sort of restraint on his actions, in the midst of lawless and strange companions, he often fell a victim to their evil influence and example, and his very weakness and ignorance made him an easy prey to their wiles and cupidity. If he made money, they cheated him out of it. He was often reduced to the brink of starvation; and at one period he subsisted for two months on a miserable species of fish called 'suckers.'

After countless trials and vicissitudes, he obtained employment at Lake Winnipeg, where he passed another decade; but even there his evil genius seemed to pursue him, for he received accidentally the contents of a loaded gun in his leg, which wound caused him at times great

suffering throughout his whole life. But he was a man of pluck and courage, and would never yield to any obstacle which perseverance could overcome. Having resolved to try his fortunes on his own account in a district involving several hundred miles of travel, he provided himself with a couple of horses, and set out attended by one serving-man. On they went till nightfall through a wild uninhabited region, where nature asserted her right to repose in their wearied limbs and failing spirits. So, having first picketed their horses, they lay down to rest in the best shelter they could find. Feeling amply refreshed by daybreak, they determined to continue their journey with no further halt till eventide. But alas for their horses! The animals had either decamped or been stolen, probably the former. After some cogitation as to the next step to be taken, Mr Beauchamp decided to send his servant in quest of the animals, whilst he remained at his post. The day passed, the night pressed onwards, and morning dawned without either horses or man having appeared. Unprovided with a compass, chart, or guide of any description, Mr Beauchamp then felt how futile his hopes must prove—that the poor man had probably lost his way, and that there would be no more meeting between them.

For a while utterly desolate, the solitary traveller bethought him of retracing his steps; but when he attempted to walk, he found himself so broken down by fatigue and over-exertion that he could only limp along, or drag his wearied body on all-fours. Finally, 'worn out,' as he himself expressed it, 'both in body and mind,' and when within but ten miles of his trading-post, he lay down with the fervent hope that death would put an end to such torture; but not liking the idea of his body being devoured by wild animals, he crawled about to get together branches of trees wherewith to cover himself. But in spite of all the man had suffered, death was still to be balked of its prey. Some Red Indians fortunately came upon him, and by his discoveries he was kindly cared for and nourished, and taken to his post, where, after some weeks, he gradually recovered.

Was it retribution or destiny, or what, that made him again such a cruel martyr to circumstances in the next episode of his career? After Lord Selkirk began to colonise the Red River, Mr Beauchamp gave up his prospects in the Fur Company and turned settler. In opposition to the Hudson's Bay Company, another had been formed, called the North-West Company. Between the two there was great rivalry and jealousy. At the instigation of some of its people, Mr Beauchamp was made prisoner, thrown into a dungeon in Fort-William, and from thence taken to Montrose, where his alleged trial was to take place, without his ever having been told of the crime whereof he was accused. After weeks of weary waiting and dread expectation, he was set at liberty without a single question having been put to him, the sole object of his oppressors having been to detach him from Lord Selkirk's interest, which they considered was synonymous with that of the Hudson's Bay Company.

Lord Selkirk's agents having meanwhile discovered that a plot was hatching at McGillivray's house in Montreal—and the nucleus of the North-

West Company—to upset altogether the infant settlement at Red River, Mr Beauchamp volunteered to set off at once and convey the first intelligence of this Guy Fawkes business to the poor unsuspecting colonists. To this end, he started for Moose Factory, in James Bay, in an Indian canoe. When about midway, he was overtaken by the rigours of a Canadian winter, with all its impediments to continued and safe travel. He had to walk to the above-named Factory, and thence along the coast of Hudson's Bay to Albury, Severn, and York factories, and on to Red River—a journey of two thousand miles, a feat which only a nature inured to privation and hardship such as we have described, together with the substratum of an iron constitution, could possibly have performed.

On the night of Mr Beauchamp's arrival at his destination, there happened to be some kind of bacchanalian revelries going on in true military style, got up by the commandant at Fort Douglas, Red River. In these our adventurer took part, but in a way that did not greatly redound to his credit. Nothing, it may be presumed, was known there of his antecedents, and as he was heart and soul devoted to Red River, he was advised to find a wife amongst the native women of Caledonia residing on the spot. The choice was soon made of a widow, and in the absence of any clergyman, the knot was tied by the civil magistrate. Shortly after, his pecuniary affairs being now in a satisfactory condition, he resolved to return to England. Whilst there, a longing came over him to see once more the love of his youth and to ask her forgiveness for the past and the boon of her friendship in his declining years. More than thirty years had elapsed since they parted, but the lady had never married. After the death of her parents, she had come into possession of a fortune, and had a handsome establishment in Portman Square. There she resided for the rest of her life, and there, too, she saw again the friend of her youth, and received his explanation. What that explanation was, never passed her lips. We may be sure that no man of birth, fortune, and social position would have sacrificed all for a trifle, and become to all intents and purposes an outlaw.

It was during this sojourn in England that he formed the plan of a 'Buffalo Wool Company,' making himself the managing partner. It turned out a miniature South Sea Bubble, for it left Mr Beauchamp minus six thousand pounds. He had returned to Canada in 1820, and an occasional interchange of letters with Miss Middleton followed. In his perfect diction and finished phrases there was still much to remind her of the fascinating polished friend of her youth, from whose pen she had received an unvarnished account of his strange career. In testimony of this, a touching record was found amongst his papers at her decease, which took place some years after that of Mr Beauchamp. When the news reached him in 1826 of the failure of his last venture, the shock it gave him redressed his fine athletic form in a few weeks to a shadow. He was first attacked by delirium, and then fell into a state of absolute despondency. But his mental faculties completely recovered their power; and just at the most critical period of his illness,

he was received and cared for by the English chaplain and his wife. When sufficiently restored, he sought some new means of employment which involved neither risk nor outlay. His last occupation was the mastership of a private boarding-school for the families of the Company's officers at the Red River. In this way he managed to support himself and his family until his death. He used to speak of himself to the clergyman's wife as 'a humble sprig of nobility,' and had ingeniously drawn out a genealogical tree—still in the possession of this lady's family—tracing his descent from Richard Cœur-de-Lion.

AI AT LLOYD'S.

AI at Lloyd's is a sufficiently familiar expression; it meets our eye in the newspaper paragraph: it stares at us from the wall-placard; and it haunts us in Feuchurch Street, E.C., Water Street, Liverpool, and other chosen homes of ship-owners. Every one recognises in it a nautical equivalent for 'first quality'; but here information on the subject usually ends. As Lloyd's Register of British and Foreign Shipping, the institution granting the title in question, has not long since celebrated its jubilee, we believe a short account of the origin of that undertaking and of the work in which it is engaged may prove of interest.

The business of underwriting or insuring against marine risks is of very ancient date; to say that it existed among the Phœnicians takes us back a long way in the world's history; and as a necessary preliminary to legitimate underwriting, as distinguished from mere chance-work, lies, and must ever have lain, in knowing that the vessel proposed to be insured is seaworthy, we may also claim for the business of the ship-surveyor a respectable antiquity.

The primitive underwriter was probably a man with a practical knowledge of ships, and who, when asked to insure a certain vessel, surveyed it himself. As business increased, however the inconvenience attending this system would soon make itself felt, and the obvious expedient of the underwriter employing a skilled man to make the survey for him and send in a report, would be adopted. From an underwriter receiving reports of the condition of individual ships, to his arranging these in tabular form, is but a step; and from individual underwriters drawing up such lists for their own guidance, to their agreeing generally to place them at the service of their brothers in the business, is but another, although the length of time that elapsed ere this latter result was reached was doubtless considerable. The oldest classified list of shipping extant dates only from the beginning of the reign of George III.; but this document—of which more anon—bears unmistakable internal evidence of being at the time no novelty.

Our story opens during the early years of the reign of Charles II.; English colonies across the sea were beginning to prosper; English commerce, notwithstanding oppressive fiscal laws, was on the increase, and the business of the underwriter naturally followed. London was then, as now, the headquarters of the marine insurance business of the country; and the city coffee-houses, then but of recent origin, were the common meeting-

places of all connected with the shipping interest: it is the name of the proprietor of one of these establishments that now lives in that of the great corporation of Lloyd's.

Edward Lloyd is one of those men of whom we would gladly know more than history has brought down to us, but of whose personality apart from his work we know practically nothing, even his proper name having been lost, until recovered by the researches of a recent writer. Finding his house in Tower Street regularly frequented by underwriters, Lloyd—who must have been a man of great ability and foresight—appears to have formed the resolution of making it the headquarters of the business; and to this end, gave facilities for meetings, arranged for sales of vessels and cargoes, started a newspaper, and practically identified his interests with those of his patrons. The newspaper was short-lived, being suppressed by government; but his labours were rewarded by his seeing his establishment—latterly removed to Lombard Street—the centre of marine insurance business not only for London but for the kingdom. Three generations of underwriters met at the Lombard Street coffee-house, and when, in 1770, having formed an association, they removed to premises of their own, and shortly after to the Royal Exchange, they took the name of their old headquarters with them; and thus it has come about that the greatest marine insurance corporation the world has seen owes its name, and to a certain extent its origin, to a London coffee-house keeper at the time of the Restoration, to whose memory the foreign shipowning Companies' titles of 'Austrian Lloyd's,' 'North German Lloyd's,' 'Argentine Lloyd's,' &c. are additional tributes. The classified list of shipping already referred to as the oldest extant is dated 1764, but is, unfortunately, somewhat mutilated. The work is arranged in a form very similar to that of the register books of to-day, giving in parallel columns the name of the vessel, tonnage, date of building, owner, &c.; and also what is evidently intended for a character or class, one or other of the vowels A, E, &c., in conjunction with the letters G, M, or B. The key to this system of classification is missing; but Mr Martin, the historian of Lloyd's, has surmised, with every appearance of justice, that the vowels refer to the character of the hull of the vessel; and the accompanying letters, being the initials of the words *good*, *middling*, and *bad*, to the character of the equipment; A G being thus a good, well-equipped ship, and UB the reverse.

How to express satisfactorily the condition of a ship by means of symbols was evidently about this time a disputed point, as in a register dated four years later an entirely new system appears, the letters *a*, *b*, *c* being used in conjunction with the Roman numerals 1, 2, 3, 4. Under this system, *a* 1, an approximation to the now familiar character, represented a good vessel; and *c* 4 its antithesis. Seven years later still, in 1775, the vowels again make their appearance for expressing the character of the hull, the Roman numerals being retained, and A 1, as the symbol for a first-class ship, comes on the scene. To decide what shall be the classification letters or numerals used in describing ships of varying character is one thing; to give to each ship the class to which

it is justly entitled is another and decidedly more difficult matter. So the London underwriters found; but instead of treating the question as one in which many interests were involved, they treated it as concerning themselves alone, and, during the closing years of last century, came to a decision the sole merit of which was its simplicity. The London shipbuilders of the day got a better price for their work than the builders at other ports, and consequently were able to, and admittedly did, turn out a better ship. Further, it might be *prima facie* supposed that a ship, built even on the Thames, was not so good after being afloat ten years as on the day of its launch. Putting these two things together, the compilers of the Register decided to class ships simply according to their age and where they were built; such events as a ship newly built on the Tees being occasionally better than a Thames-built craft of the same size that had been knocking about the seas for five years; or a thirteen-year-old ship under good management being actually in better repair and more seaworthy than an eight-year-old one in careless hands, being held to be contingencies needless to provide against. It was hardly to be supposed that the shipowners would agree to a system of classification which practically placed a monopoly in the hands of certain builders, and which decreed that existing ships after a certain period would lose their class, no matter how perfect their state of repair; and the result of indignation meetings on the subject was the starting of a new Register of shipping; thereafter known as the 'Red Book,' the former, or underwriters' register, being known as the 'Green Book.' From the date of founding of the Red Book, the history of ship-classification, from being fragmentary, becomes continuous; and, had the popular saying, that competition is the life of trade, been of universal application, great advance might have been looked for; the law of supply and demand, however, stopped the way. There was not sufficient work for the two Registers; each found it difficult to meet its expenses without taxing its supporters; and although, during the thirty odd years the rivalry lasted, some advance was made, still, during the whole of that period the relationships of shipbuilders, shipowners, shippers, and underwriters one to the other were on an unsatisfactory footing. Nowadays, it is recognised—and no one thinks of disputing the justice of the arrangement—that the shipowner, being clearly the person most interested in his ship bearing a high class, should pay the expense of all surveys. This apparently elementary truth was, however, far from being recognised sixty years ago, the opinion then being that the interested parties were the shippers and underwriters.

After the close of the war with Bonaparte, when privateering was a thing of the past, and convoys of frigates were no longer required, the shipping trade of England rapidly increased; each Register was impelled to keep pace with its rival in adding to its number of ships registered, and the expense of surveys increased in proportion, the number of subscribers remaining but little altered. This was the beginning of the end. By the time that a fourth of the present century had elapsed, the rival Registers

were in a hopeless condition; but ten years more of trouble and dispute had to pass ere differences were adjusted, jealousies set at rest; and the 'Red' and the 'Green' now united, commenced a fresh career of usefulness under the title of 'Lloyd's Register of British and Foreign Shipping,' the new departure dating from January 1835. The Committee of management of the new Register was supposed to represent in equal proportions the interests of the shipowners, shippers, and underwriters, and, so far as London was concerned, it doubtless did so. With, however, that preference for men and things metropolitan, not unknown yet on the banks of the Thames, the interests of the other shipping ports of the United Kingdom received scant recognition, and the result was the perpetuation of grievances, the effects of which have lasted to our own day. Of much greater importance than the mere union of the rival Registers was the adoption of the system of surveying and classification, which, although improved in detail to an extent then undreamt of, is in operation still. It was settled that henceforth vessels were to be classed on their own merits as at date of survey; that the class should be fixed by the committee on the report of the surveyor; that vessels built with a view to class should be under survey during the course of construction; and that the shipowner should pay the survey fees.

At the date of the founding of Lloyd's Register, and for untold generations before, the one material used for building ships was wood. Long experience had made its properties common knowledge, and it might reasonably be supposed that shipbuilders would long since have come to an agreement as to the dimensions, say, of the ribs, keel, or planking of a ship of given size; such, however, was far from being the case. Owing, possibly, in part to the fact of ships built at one port being assumed inferior to those built at another, and the builders accepting the situation, and certainly in part to the fact that the rule of thumb was then the leading rule in British naval architecture, the practice in one part of the country differed widely from that in another. To induce the adoption of a uniform scale of ship scantlings founded on the best practice was one of the first tasks attempted by the Committee; but while its members were yet considering the proportions of wooden ships, an influence was at work in the world that was shortly to render their labours of small account. Along with the old familiar click of the calker's mallet, the dwellers by river-banks began to hear mingle a new sound, the rattle of the riveter's hammer; and by the time Lloyd's Register had completed its tenth year of work, the Great Britain had crossed the Atlantic, and the Iron Age had come. The ship-designer found his business brought back at a single step to the experimental stage, and the Committee and surveying staff of Lloyd's Register found that they had a new business to learn. It is probable that every branch of human industry has been, at one period or another of its history, the subject of trade secrets; iron ship-building in its earlier days was no exception, and, as no builder thought it his interest to initiate Lloyd's Register, that body had no share

in the development of the iron ship. This was probably the best arrangement; the days of competitive tenders and 'poor man's ships' were yet in the future; and the men who launched the *Great Britain*, the *Persia*, and the *Great Eastern*, were more in a position to teach than to be taught. In 1844, Lloyd's Register agreed, for the first time, to give the A1 class to iron ships built under their survey, on the surveyors' report that they were of good and substantial materials and workmanship; and eleven years later, their first rules for iron ship-construction were issued.

Landsmen who voyaged in the wooden ships of the past were but too familiar with the creaking that went on without intermission whenever weather of a certain degree of roughness was met with. This was due to a slight rubbing of the timbers one on another, and was no sign of weakness, it being impossible with a yielding material like wood to drive bolts absolutely tight. The amount of straining and actual distortion that a wooden ship might undergo and yet remain fairly seaworthy, was astonishing; and a go-ahead skipper preferred a springy ship to a stiff one. With iron, the conditions were entirely changed; rigidity proved essential to safety, and loose fastenings were fatal. It was this necessity for rigidity that made it possible to frame constructive rules from the observation of the behaviour of comparatively new ships, old and tried ones not being then in existence. On examining an iron ship after a single voyage, the surveyor, provided always the painter had not been at work before his arrival, could point unchallenged to the weak points of her structure—started joints, cracked plates, and bent bars, telling their tale only too plainly. For reasons which are not far to seek, but which need not be entered upon here, the rules for the construction of iron vessels issued by Lloyd's Register in 1855 did not meet the success their framers intended. Greatly improved rules were issued in 1863; but it was not until 1870 that the Committee emancipated itself from various obsolete ideas, and, under the guidance of the honoured gentleman who now holds the position of Secretary to the Register, issued rules in the form now existing. Various editions of these rules appeared from time to time, each more comprehensive than its predecessor; for some years past they have been issued annually; and those now current leave little to be desired so far as completeness is concerned. Lloyd's Register grants three leading classes—namely, 100 A, 90 A, and 80 A; the numeral 1, making 100 A1, being added to keep up the time-honoured classification mark. The system of classification a century ago, provided, as we have seen, for differing qualities of outfit in ships otherwise bearing the same character, and the numerals 1, 2, 3, &c. were used, accordingly; but the fact has come to be recognised that a good ship with a bad or insufficient outfit is practically a bad ship, and the 100 A class is not granted unless the outfit be up to the requirements of the numeral 1.

In addition to the above-named classes, Lloyd's Register will survey and grant the class A for a vessel designed for almost any desired service, the plans being submitted for their approval;

for instance, the swift steamers that carry the mails in connection with the South-Eastern Railway are classed 'A. Folkestone and Boulogne Passenger Service.' These special classes, however, are not taken advantage of to any great extent.—Two classes of surveys are held—the 'Ordinary' and the 'Special.' The first consists in a given number of visits paid to a ship at certain periods during construction; the second, in a systematic inspection of the vessel at short intervals, from the time of laying the keel to that of certifying to the anchors and cables being the proper weight. The first of these, as might be imagined, is open to various drawbacks; and few shipowners who desire a class at Lloyd's hesitate to incur the somewhat greater expense of a 'special survey,' which, as it includes the machinery also if the vessel be a steamer, practically saves the expense of a private inspector. Lloyd's survey only extends to the structure of the ship, and takes no account of the fitting-up of the cabins and other work connected with the accommodation or comfort of crew and passengers; the class meaning simply that, in the opinion of the Committee, the ship is strong and seaworthy. The work of surveying is carried on in the United Kingdom by about one hundred surveyors, who give their whole time to it; in addition, about three-fourths of this number scattered throughout the world give their services in part. The Committee of management, whose headquarters is in Cornhill, consists of fifty members, representing the different ports of the country, although by no means in proportion to their relative standing, London securing about half the total representation. The Register Book, which represents the results of the labours of Committee and surveyors, is a ponderous volume, and gives the particulars of all the vessels now afloat that have received Lloyd's classification, in addition to the particulars of numbers of other vessels not so classed; in fact, the Register Book is a great shipping directory, the ship, not the owner, being the leading feature.

Lloyd's Register is not alone in the field of surveying and classifying ships. Liverpool up till a year ago had a registry of its own, the 'Liverpool Underwriters' Registry.' This has now united itself with Lloyd's Register, a fact which, for some reasons, is to be regretted. Paris is the headquarters of the 'Bureau Veritas,' an undertaking whose classification is in repute in Scandinavia, North Germany, the Netherlands, and France; and which maintains a staff of surveyors in the United Kingdom. This undertaking is not a representative one, and on this ground has been objected to. It is doing useful work, nevertheless; and its system of classification is superior to Lloyd's, inasmuch as it takes into account the service for which the vessel is intended. A kindred institution to the 'Bureau Veritas' looks after the shipping of Italy, and is known in this country as the 'Italian Veritas,' while the 'American Lloyd's' controls to a certain extent the building of ships on the Delaware, but is unknown in this country, on account of the well-known navigation laws by which only native-built craft can sail under the stars and stripes.

Classification Societies are not an unmixed benefit to the community, still less have they

an unmixed influence for good on the design of ships. Theoretically perfect rules would proportion the strength of every individual ship to the work it had to do; but, as Lloyd's Committee, through whose hands the designs for over eight hundred ships probably pass in the course of a year, have no possible time for going into such detail, standard types of vessel have been adopted, the designs submitted being compared with these on the basis of their *dimensions* alone. The natural result of this is that ships are in many cases built to suit Lloyd's type; and the art of the ship-designer but too often has degenerated into getting the maximum of advantage out of certain dimensions which are known to bring the vessel just within the limits of one of these types.

In the days gone by, ships were built for a certain trade, and kept at it, the East Indianman, the West Indianman, and the Atlantic packet seldom interfering with each other. The leading steamship Companies naturally adhere to this system still; but, during recent years, hundreds of individually owned ships have been set afloat, designed for no special trade, but simply to carry the maximum cargo on the minimum cost wherever a freight offers itself. It is largely from the necessity of making its rules applicable to these privateers of trade that the frequently grumbled-at oppressiveness of Lloyd's Register arises. This brings us to notice that some first-class steamship Companies do not class their vessels at all; and it may cause surprise to many to know that of those steamers whose rapid passages across the Atlantic have made their names familiar, the majority are *not* A 1 at Lloyd's. The reason for this is simply, that a skilful designer who knows thoroughly the requirements of the service for which a ship is intended can always turn out a better and more economical vessel than one built to class, a fact which more of the leading steamship Companies will doubtless come to recognise before long. The rules of Lloyd's Register for the construction of iron vessels are growing in stringency from year to year; a vessel built to class ten years ago, and which has proved her efficiency by doing the work for which she was designed during all that period without a complaint, would, if built to-day, require a large percentage of additional weight put into her structure to bring her strength up to the demands of the current rules. That this is so is due to the fact that, up till quite recently, Lloyd's Register has taken account of one element only out of the several that the question of the safety of a ship on the ocean involves. For years past, the aim of the Committee has been to take from the shipbuilder more and more of the responsibility which he at one time bore for the strength of the vessels he builds, until now his share is practically *nil*; while it has been but too evident for years past, from the disclosures that now and again have been elicited before the Commissioner of Wrecks, that a good ship may be badly stowed, overloaded, or undermanned, and, under such circumstances, be in much greater danger from sea-risks than a far inferior ship in good hands.

The aim of Lloyd's Register is the protection of the shippers and underwriters against undue

risks, and the present high rates of marine insurance show that this protection is not what it might be. If the trouble and expense now devoted to securing strong vessels are not to continue to be thrown away, as they certainly are at present in a fair percentage of cases, the Committee will require to take steps to insure that a ship bearing their highest class shall not take the sea with a cargo badly stowed, an insufficient crew, or too little freeboard. The question of freeboard is already engaging attention; the other points cannot long be left in their present state; and the day will then come when shippers will think with wonder of the times when premiums at the rate of ten per cent. were paid for insuring cargoes in ships that were 100 A 1 at Lloyd's.

DESTRUCTIVE INSECTS.

THE Agricultural Department has issued two Reports by Mr C. Whitehead, F.L.S., F.G.S., dealing with Destructive Insects. The first of these treats of 'Insects Injurious to Hop-plants.' In the opinion of the writer, there is an increased and increasing risk of loss and destruction from injurious insects to many of the crops cultivated in this country. We scarcely grow anything exempt from the ravages of these pests. They attack corn of all kinds, fruit-trees, hop-plants, clover, turnips, mangold-wurzel, &c. Although some kinds are well known and long known, others are new, or, at anyrate, they have only recently been noticed. In certain instances they appear to have been imported with the plant, as, for example, the mangold-wurzel fly, *Anthomyia beta*, which, within the last five years—contrary to the opinion of Curtis, who, writing in 1859, thought its injuries would not be of much consequence—has wrought much mischief. The turnip-fly again, which originally fed upon charlock and other cruciferous plants, has now quitted these, because the turnip supplies more suitable food. With its increased cultivation, this fly has multiplied enormously, as the farmer knows to his cost, for, in seasons favourable to its development, it sometimes destroys whole fields and causes great loss.

Cultivation is not only favourable to such old offenders, but it seems to have introduced entirely new ones; at least, the farmer now finds that wheat, clover, and other crops raised by rotation in the same fields, suffer injuries from insects, which, if they existed formerly, escaped notice. It may be, however, that the scientific spirit of late introduced into agriculture has only just discovered what in many cases has always been going on. At the same time, it is universally admitted that the destruction occasioned by insects is larger than ever it was, and that there are insects at work in the fields which were little, if at all, known to our forefathers.

One very good reason for the progressive increase of agricultural plagues is that they multiply proportionately at a much quicker rate than the plants on which they feed. We are actually rearing them artificially, and the problem is how to cultivate crops without at the same time cultivating these parasites. High-farming, by pampering plants, no doubt renders

them more delicate and more liable to attack; but perhaps we help to make our own trouble by not exercising ordinary caution. Certain it is that destructive insects are imported into, as they are exported out of, this country. The agricultural produce which we bring from various parts of the world must contain many unwelcome visitors, though, fortunately, our climate does not agree with the majority of them. Like the famous Colorado Beetle, even if allowed a fair chance, they would scarcely thrive. Others there are with the Scotsman's reputation of being able to do well anywhere. They only require a suitable plant to feel perfectly at home. They sometimes get 'assisted' emigration at the cost of their favourites, like the hop aphid, which was introduced into America among hop-roots sent from England. The former country has by entomologists been styled 'the home of insects;' but, to Europe's loss, one highly interesting though destructive American crossed the Atlantic—namely, the phylloxera, so destructive to vines. An individual that undergoes various puzzling transformations is not readily identified, and the hop aphid, having these disguises, has alarming opportunities of getting a footing where it is least wanted. Indeed, all such destructive insects should receive more study than they have hitherto obtained. Within the last few years, scale insects were introduced into the Californian orange groves from Australia; and orange, citron, and lemon growers in other parts of the world are now complaining of pests of a similar nature. Considering the evil which has been already accomplished, it is highly important that farmers, fruit-growers, gardeners, and all who cultivate the land should be made acquainted with all that is known regarding the insects which attack their several crops.

The hop-plant in particular has many enemies, some of them so destructive, that if not checked, they would soon ruin the grower. Within the last thirty years, it is believed the liability of this plant to attack by insects has considerably increased. Hop-planters assert that insects now destroy their crops which were not known in the plantations until recently. Mr Whitehead selects ten of the most troublesome species, and gives descriptions of each insect, together with its life-history, its modes of attack, and the injury to the hop resulting therefrom; also a detailed account of methods of prevention, and of measures which have been found efficacious in stopping or alleviating these attacks.

Mr Whitehead originally intended to confine his second Report to insects injurious to corn-crops; but as the work progressed, it was found desirable to include those destructive to grass-crops, as some insects are common to both. While dealing with cereals, he also thought it well to treat pulse, under which title are included plants such as peas, beans, and tares, and to describe the principal insects which affect them, especially as they are all crops liable to be attacked by the same insects. A description of a genus the most injurious to different kinds of clover, is also given. To include comparatively harmless insects in a work which is intended not so much for scientific purposes as to enlighten farmers and others regarding the pests which molest them most, was

not necessary. For sufficient reasons it has been found most expedient neither to arrange them alphabetically nor according to a recognised scientific classification, but to take the insects of each group as far as possible in the order of their injurious effects. Indeed, there are included what, in the scientific acceptance of the term, are not insects at all. But the Report was written to convey useful and practical instruction to the cultivators of the soil, and wisely it was done in the manner which was likely to benefit them most. 'With regard to these' (the chief pests), Mr Whitehead writes, 'it has been endeavoured to collect all the information that is known about them, and to bring this down to the latest date. It is believed that each monograph is a *résumé* of all that is known of its subject, of its life-history, and the means of prevention, and remedies against it. It is admitted that in several instances the information is still imperfect; and in compiling this series of Reports, I have been more than ever impressed with the necessity of enlisting skilled workers in this cause, as well as of urging and encouraging habits of observation amongst those who superintend the cultivation of the land and those who work upon it.'

A NURSE.

A NURSE, a simple nurse; to the unthinking
Only a nurse, and nothing but a name:
A patient woman in her round of duty,
Living and dying all unknown to fame.

Only a nurse, a messenger of mercy,
An angel sent unto our suffering race,
With quiet step, and tender hand of healing,
Divinest pity on her gentle face.

When all the world lies wrapt in quiet slumber,
Save the poor sufferer moaning on his bed,
Whose watchful eyes with Christian love keeps vigil
Through the long night with silent softened tread?

Only a nurse, in duty all unshinking;
Before such scenes, man's stouter heart would quail:
See thro'! that sweet, fair girl, in sorest trial
Is at her post, nor will her courage fail.

The fever we hut terror-struck encounter,
Or fly before with selfish, coward dread;
While nurse and doctor hasten to the rescue,
And stand unflinching by the stricken bed.

Hark! that weird bell—an accident at midnight;
The nurse and doctor, wakeful, close at hand,
Who minister to suffering or dying,
The hospital's heroic little band!

Thers you or I may in our need find refuge,
With kindly help and loving tender care;
Respect we give those brave, unselfish women,
And night and day, remember them in prayer.

THE MAORIS' FIGHT FOR LIFE.

BY A NEW ZEALANDER.

AN absorbing struggle is going on in New Zealand at present—a struggle of life and death to a gallant and interesting people. The Maoris are apparently making a last stand for existence. Like all savage peoples, they have hitherto been 'melting away' at the approach of the whites, until now it is believed they number barely forty thousand throughout the entire colony; whereas in 1835, before English colonisation had commenced in earnest, careful observers estimated that nearly two hundred thousand natives ranged the woods and navigated the rivers and seas of the colony. Captain Cook, probably less accurately, placed his estimate at four hundred thousand. Certain it is that from the time we have first known them, the Maoris, like the Kanakas of the South Sea Islands and the Red Indians of North America, have gone on steadily and even rapidly diminishing in numbers. Just now there is reason to hope that this process of extinction has received a check, and the race seems gathering together all its energies to make one last struggle for existence. Will it be successful?

In the first place, let us glance at the causes leading to the extinction of the aboriginals of New Zealand. These have been very ably set forth in a paper read before the Wellington Philosophical Society by Dr Newman, President of the Society. This gentleman is of opinion that the Maoris were a disappearing race before the English came to New Zealand. One of the principal causes is the natural sterility of the people. While the birth-rate among the European inhabitants of New Zealand is the highest in the world, and while the prolificness of animal life generally in this fertile land is a matter of constant wonder to the naturalist, a birth in a Maori family is, as a rule, of less frequent occurrence than a death; and the absence of children in the native villages is absolutely startling to those

who have just seen the troops of rosy-cheeked youngsters that swarm in the European towns. There are various causes for this unfruitfulness of the race; but the principal source assigned by the writer I have quoted is intermarrying, the Maoris being nearly always married either in their own or some nearly adjacent tribe. The rate of mortality, also, is considerably higher among Maoris than with Europeans, consumption being responsible for the greatest ravages in their ranks. The Maoris, who formerly lived in lofty, well-aired, and well-drained hill-forts, now dwell on the oozy soil of the valleys, where the air is stagnant and moisture-laden, while their *whares* or huts are close and unventilated—forming, in fact, hotbeds of lung disease and rheumatism.

Dr Ginders, the medical officer at the government sanatorium at Rotorua, which is situated in the middle of a large native district, gives, in a Report recently presented to parliament, a graphic and at the same time horrifying account of 'How the Maoris live.' Referring to their sleeping-huts, he says: 'Being curious to know something of these hotbeds of disease, I entered one at seven A.M. before the occupants had turned out. I have no wish to repeat the experience. This was quite a small family affair, fifteen feet long by ten feet wide. It contained twenty individuals of both sexes and all ages, who had spent the night—say ten hours—in it. The cubic air-space per head was about such as would be afforded by a comfortable full-sized coffin. How they can exist under such circumstances is one of the mysteries of Maori nature. Fortunately for them, these sleeping-places are built of pervious material, through which the ~~ocean~~ air must filter, and all the more rapidly from the fact of the great difference of temperature between the external and internal air.'

After reading this extract, most people will be inclined to say that it is not necessary to look any further for the cause of the gradual dying out of the Maoris. It is some satisfaction to reflect that the imported diseases and vices are

playing only a minor part in decimating the race. Of the diseases introduced by Europeans, typhoid and measles seem to have been the most destructive, especially the former. The only imported vice, according to Dr Newman, that has in the least degree helped to hasten the disappearance of the race is drunkenness. The mortality among children, from the neglect or ignorance of parents and the insanitary conditions in which they live, is appalling, and until something can be done to check it, any hope of preserving the race must of course be abandoned. The advent of Europeans has undoubtedly brought with it many causes likely to operate unfavourably on their dark-skinned brethren. Some of these have already been mentioned, drink unquestionably occupying a bad pre-eminence.

There is also no doubt among medical men that a partial adoption of European habits and customs, accompanied by a retention of various features in their barbarous mode of living, is the cause of much sickness and even mortality. Dr Newman points out one very characteristic fact: formerly, when the natives entered their *whares* with their wet mats on, they flung them aside; now, when they get wet in their European clothing, they keep it on, thus laying the foundation of many diseases. On the other hand, civilisation has introduced undoubted benefits. For example, the Maoris formerly subsisted on fern-root and such hard fare, and found that difficult to get at times. Now, they have an abundance of wholesome food, and can live in comfort on the revenue derived from their lands, if they do not spend their money in debauchery. As the result of the labours of the West Coast Royal Commission, for instance, every native in the confiscated territory in the North Island who has any right to be there, now has an interest in some reserve or other which will provide him with a settled homestead and the means of maintenance, and in many cases a considerable pecuniary income besides. Naturally, in not a few instances these material advantages are demoralising to the Maoris, who, when able to live in independence and luxury, will not work.

Many of them, however, especially on the east coast and in the north, are devoting themselves industriously to such occupations as sheep-farming, maize-planting, tobacco-growing, &c. I read, in the Reports of the native officers, that one tribe started farming with a flock of four thousand sheep, and divided the year's profits, which actually amounted to seven hundred pounds. Another party of natives did better still at whale-fishing, securing spoil from the deep to the extent of two thousand six hundred pounds.

Among all the elevating influences brought to bear upon the Maoris, the means of education appears to be the most promising; and if they succeed in averting the fate of extinction, to which so many savage tribes seem doomed when brought in contact with a higher civilisation, education will be the chief agent in bringing about the happy result. With the advance of education, it may reasonably be hoped that the Maoris—who are naturally a very receptive people—may be brought to see the evils of consanguineous marriages, to adopt more rational sanitary measures both as regards their children

and themselves. At present, they have very erroneous and mischievous ideas of disease. When an epidemic of typhoid fever broke out among some of them recently, they were utterly regardless of the danger of infection, and ridiculed the idea of taking any precautionary measures to prevent the spread of the disease, saying it was not fever, but simply a Maori complaint brought on by *makutu* or witchcraft. When a native is attacked by illness, he frequently succumbs through sheer fright. It may easily be imagined how these facts increase the mortality of the race, and what improvement may be effected in these respects by the advancement of education.

It is satisfactory to note that the government are alive to the importance of the subject. According to a recent official Return, it appears that there were sixty-nine native schools in full working order, and over two thousand Maori children receiving the elements of a good English education. The great advantage of these schools, it has been very well pointed out, is not so much that the young people learn to speak the English language, but that they learn to appreciate our customs, to value time, and to gain a desire for improvement, both mental and social, which, doubtless, they will transmit to their descendants, who will then become fitted to hold a fair position in the future. The natives generally appear to be alive to these facts, and not only send their children to the schools, but give sites for school-buildings, and show their interest in the movement in other ways. They elect their School Committees in the same way that the Europeans do, and on the whole do the work very well.

The Blue Ribbon movement appears to have taken a singularly firm hold among the race. The so-called 'king' himself donned the badge with great ceremony at the solicitation of Sir George Grey, before leaving for England in 1884; and in every village are to be seen numbers of the young Maori 'braves' wearing the 'bit of blue' as among the most cherished of their decorations.

The outlook, then, as regards the conflict in which the race is at present engaged, is so far satisfactory. The question will, however, naturally be asked, whether the beneficial effects of the educative process are permanent, or whether, after the Maoris leave school, they relapse into their old habits and customs. The savage nature, we know, is very apt to reassert itself. Miss Bird tells us how the Ainos of Japan educated at Toki relapsed into barbarism on returning to their own people, retaining nothing but a knowledge of the Japanese language. Another writer recounts how an Indian girl, one of the most orderly of the pupils at a lady's school, has been known, on feeling herself aggrieved, to withdraw to her room, let down her back hair, paint her face, and howl. Something of the sort, it must be confessed, is not altogether unknown in New Zealand. I once went to see a Maori *haka* or dance, interesting in its way, but not more edifying than native dances usually are. To my amazement, I saw among the performers a young lady whom I had known as a well-educated Maori girl, living in good circumstances, possessing excellent taste

in dress, and who had been in the habit of taking her place with advantage in European ballrooms. On this occasion her costume, although not more *decolleté* than European evening dress frequently is, would have created considerable sensation in an English gathering, consisting as it did simply of a loose calico gown. A very handsome, well-informed half-caste, one of the most lady-like persons I ever met, once confessed to me that she could never look on at a Maori *tangi* or wake without feeling an irresistible inclination to rush in and tear her hair and howl like the rest. In fact, she admitted that she had to leave such scenes, or her emotions might have become too strong for her self-control. Again, I shall not soon forget the surprise created, a few years ago, when one of the most promising young Maoris in Wellington, who had been brought up with Europeans from childhood, who was being educated for a barrister, and who promised to be one of the ornaments of the profession, suddenly disappeared, and was next heard of as having flung off his European clothes and joined the fanatical followers of a half-demented Maori prophet known as Ta Whiti. No inducements could prevail on him to return to civilisation, and he became one of the most devoted and credulous of the prophet's adherents.

These, however, are exceptions, and not the rule. We have Maori members both of the Upper and Lower House who are a pattern to some other legislators in many respects, and can take their place in any European society. We have Maori clergymen both Anglican and Wesleyan who appear to make pastors of the most exemplary kind. There is as yet no Maori lawyer in practice, but some native lads are being trained in solicitors' offices, and there is every prospect of their naturally keen wits enabling them to take a good position in the profession. So far as I am aware, they are not ambitions of becoming doctors; and some malicious people may be cruel enough to suggest that as regards the longevity of the race this is rather an advantage than otherwise.

Some of them are being trained to trades; and it is suggested by the organising inspector that every boy, after he has gone through the village school course, should, if his parents wish it, be apprenticed to some trade by the government, so as to insure his obtaining a proper industrial training. With the Maoris grounded in a proper knowledge of social and sanitary laws, with their moral and intellectual instincts properly guided and cultivated, there seems yet to be a hope that the prophecy so often made, that the race must speedily die out, may be falsified. This is the opinion of a medical man to whom I have already referred. In his Report to the native Minister, Dr Ginders, after mentioning the prevalent diseases among the Maoris, says: "In my opinion, the production, and severity, and the spread of these diseases are determined by two main factors: first, the influence of the *wharepuni* (sleeping-bunt), and secondly, the consumption of putrid food. Compared with these two gigantic evils, alcohol is nowhere. Were there no *wharepunis*, I believe the Maori would be a successful rival of his European neighbour in sobriety and industry; but with his blood vitiated by the foul air of these hotbeds of disease,

he has neither strength nor inclination to work, and it would be odd, indeed, if he had no craving for stimulants. I am inclined to credit the *wharepuni* with more than half the infant mortality. Not only is the child injured directly by this devitalising influence, but indirectly through the mother, whose milk is diminished in quantity and impoverished in quality by the same cause. I believe the growing intelligence of the rising generation of Maoris has already checked the rapid decadence of the race. I believe, too, that these evils will gradually die out, and we shall find the native population increasing *pari passu*."

New Zealand at the present time, it will be seen, has a grand opportunity for assisting in the achievement of a civilising feat which, if successful, will go very far to confute those pessimists who declare that our modern civilisation is a delusion and a snare, utterly destructive to the weaker races with whom it is brought in contact.

BY ORDER OF THE LEAGUE.

CHAPTER VIII.

THE first act in the drama was about to be played—the puppets all arranged, all acting for themselves, never heeding the hand of fate in it. Hector le Gautier triumphant, but troubled occasionally by the loss of his device, yet trusting to his own good fortune and matchless audacity to pull him through.

The curious in such matters, the idle folks who dream and speculate, had food for reflection in their *Times* next morning, for on the front sheet on the second column appeared an announcement. It was vague; but one man understood it. It ran:

MOIDORE.—How reckless of you to throw away a life on the hazard of a die. They are all safe but yours. Where is that? In two months you will have to deliver, and then beware of the wrath of the Crimson Nine. It is not too late yet. Under the clock at C. x at nine—any night. Use the sign, and good will come of it.—EASTERN EAGLE.

The *Times* containing this announcement lay upon Isodore's breakfast-table in Ventnor Street, Fitzroy Square. As it rested upon the table, the words were readable, and Isodore smiled when they caught her eye as she entered. She took up an album from a side-table and turned over the leaves till she came to the portrait of a pretty dark girl of about seventeen. At this she looked long and intently, and then turned to scrutinise her features in the glass. There was nothing coquetish about this—no suspicion of womanly vanity, but rather the air of one who strives to find some likeness. Apparently the examination pleased her, for she smiled again—not a pleasant smile, this time, but one of certainty, almost cruelty; and a vengeful look made the eyes hard for a moment.

She turned to the photograph again, and then once more back to the mirror, as if to be absolutely certain of her convictions, that there might be no mistake.

While absorbed thus, Valerie la. Gautier

entered the room and looked at Isodore in astonishment. 'You have a grand excuse,' she said archly, 'though I did not know that vanity was one of your failings, Isodore.'

Isodores blushed never so faintly, not so much by being taken in the little act, as by the appearance of the thing. 'It is not on any account of mine,' she said; 'rather, on yours.—Valerie, look here carefully and tell me if you know that face.' She indicated the portrait in the album; and her friend looked at it earnestly.

After a few moments she looked up, sinking her head doubtfully. 'No,' she replied. 'It is a strange face entirely to me.'

'Then I have altered since that was taken five years ago.'

'Is it possible that innocent, childlike-looking face could have once been you?' Valerie asked in unfeigned astonishment.

'Indeed, it is. There is nothing like sorrow and hardship to alter the expression of features, especially of women. Yes, Valerie, that is what I was when I met him. You would not have known me?'

'No, indeed. They might be two different faces.'

'So much the better for me—so much the worse for him,' Isodore observed without the slightest tinge of passion in her tones.—'Read that paragraph in the *Times*, and see if you can make anything of it.'

'It is Greek to me,' Valerie replied, when she had perused the advertisement with a puzzled air.—'Has it any allusion to my—to Hector?'

'To your husband? Yes. He will understand it in a moment, and only be too eager to regain his insignia. There will be a happy union of two loving hearts some night in Charing Cross Station. Little will the spectators know of the passions running riot there.' She laughed bitterly as she said these words, and threw the paper upon the table again. She was in a strange mood this morning.

'Then I suppose that C. x means Charing Cross?' Valerie asked, 'and you expect Hector to come there?—I do not quite comprehend your plan, Isodore. It will be dangerous to have another in the secret, and I suppose some one will have to meet him.'

'Some one will,' was the calm reply. 'And who, do you think, is the proper one to do that? Who better than his old friend and once passionate admirer, Isodore?'

'You meet him?' Valerie cried. 'How daring! Suppose he should recognise you, how then? All your schemes would be thrown to the winds, and we should be defeated. It is madness!'

'You forget I have his badge of membership; besides, I have a duty to perform beyond my own feelings in the matter—my duty to the League. But he will not recognise me after the lapse of years, and I must get to the bottom of his traitorous designs.'

'You are reckoning upon certainties, Isodores. Suppose you are wrong—suppose he is, after all, no traitor, and that your ideas are only fancies. How then?'

'He is a traitor—instinct tells me that. Wait and see what Lucrece has to say, when she comes. She is sure to have gleaned some information by this time.'

Hot revenge is apt to burn itself out quickly, from its very fierceness; but such hate as this never dies. There was a cool deliberation in Isodore's words which struck her hearer with great force; and much as she herself had suffered, she could not realise a passion such as this. It is probable that had she met her recalcitrant husband, a few words would have obtained for him forgiveness; but she was under the spell now, and her weaker will was swallowed up in a strong one.

'Do you expect Lucrece this morning?' Valerie asked.

'I am expecting her every moment,' Isodore replied. 'She promised me to come to-day and let me have her report.'

They sat in silence for a few moments, when Lucrece entered. She was quietly, almost plainly dressed, and wore an air of extreme meekness.

'You look the character,' Isodore said approvingly. 'You might have been a menial all your lifetime.—I am all impatience. Begin!'

'In the first place,' Lucrece began without further preamble, 'I like my situation; and as to my new mistress, to know her is to love her. You have no idea how gentle and thoughtful she is. Now, to begin with her. The dear Hector has a rival, and a powerful one; his name is Frederick Maxwell, and he is an artist. From what I can see, they are engaged.—Isodore, this Maxwell has joined the League, and will be introduced by Salvarini.'

'Frederick Maxwell! Carlo's old friend! Poor fool! Le Gautier has tools enough.'

'He is a fine handsome Englishman; honour and honesty stamped in every line of his face; just the sort of man to be made useful.—But to continue. Le Gautier is *l'ami du famille*. He has a wonderful influence over Sir Geoffroy, and has succeeded in fascinating Enid—and she hates him notwithstanding. Isodore, Le Gautier is at his old spiritualistic tricks again.'

'Ah!—Tell me something of Sir Geoffroy.'

'I am coming to that. Last night, my mistress was out very late, not getting home till past one. It has been my habit to wait for her in the back dining-room, and last night I was sitting there in the dark, dozing. I was awakened by the entrance of Sir Geoffroy. I could see his face was ghastly pale, and he kept muttering to himself, and some words at intervals I caught. 'I wonder if it was jugglery,' I heard him say—"if it was some trick of Le Gautier's?—No; it could not be; and yet, if I am to have any peace, I must fulfil the compact—I must join this Brotherhood. And Enid, what will she say, when she knows? What will Maxwell think of me?—But perhaps Le Gautier is already married.' I could not catch any more. What do you think of it?'

Isodore was following the speaker so intently, and so engrossed in her thoughts, that she did not reply for a moment. 'You can help us here, Valerie. Tell us what you think.'

'Lucrece is perfectly right,' Valerie replied. 'I have hitherto told you that my husband used to dabble in such things; nay, more, as a conjurer he was probably without a rival. He made a great reputation at Rome before the thing exploded; and indeed, to a weak mind, some of the stances were awe-inspiring.'

'It seems to me,' Isodore put in reflectively, 'that Le Gautier has worked upon Sir Geoffrey's superstitious fears till he has him bound fast enough. And you say he is to join the Brotherhood. Really, I begin to feel an admiration for the man I am pledged to destroy. It is clear that he has promised his daughter to Le Gautier. Is she weak?'

'On the contrary, though she is gentle and tractable, there is much determination of purpose underlying her gentleness.'

'You have done wonders in this short time, my sister. But do not relax your vigilance now; let nothing escape you that may be of use to us.'

'I must return,' Lucrece explained, looking at her watch, 'or I shall be missed. I will not fail to bring you such information as falls in my way from time to time.'

After she was gone, the women sat quietly for a time, each pondering over what they had heard. The information was not much; but it sufficed to show them in what way the influence over the weak baronet had been obtained, and every detail of Le Gautier's movement might be of use. A wild plan formed itself in Isodore's busy brain, as she sat thinking there. 'Why should it not be?' she thought.

'Do you think it would be possible for any one to love me?' she asked.

Valerie looked into the beautiful face and smiled. 'How otherwise?'

'Then it shall be so. Valerie, I am going to make Hector le Gautier love me as he never loved woman before!'

CHAPTER IX.

Hector le Gautier, all unconsciously of the plot against his safety and peace of mind, sat over his breakfast the same morning. He was on remarkably good terms with himself, for all his plans were prospering, and for him the present outlook was a rosy one. His plans were well laid. He intended to keep his present position in the League, to go to Warsaw if necessary; and now that he had Sir Geoffrey in his hands beyond all hope of extrication, it was easy enough to send Maxwell upon some dangerous foreign mission, where, if he escaped with his life, he would henceforth be an outlaw and a fugitive. Sir Geoffrey, too, had bound himself to join; and with this lever, he could work upon Enid's fears to perfection.

He was in no hurry; he was far too consummate a rogue, too accomplished a schemer, to ruin the delicate combination by any premature move, preferring for the present to renew his forces and calculate his advance, as a chess-player might when he knows the game is in his hands. Then should come the crowning act, by which he should rid himself of the irksome chains which bound him to the League. All his plans were prepared for delivering the leaders into the hands of justice, always with a care to his own escape. As he turned these things over in his mind, he whistled a little air gaily, resumed his breakfast, and opened the broadsheet of the *Times* to see the news of the day.

Fortune seemed to be smiling upon him, he thought, as he read the mystic announcement

in the second outside column. Here was the thing which had caused him so much anxious thought as good as delivered again into his hands. Some friend, perhaps, had discovered his loss, and had determined to return it thus. Perhaps—and here he showed his white teeth in a dazzling smile—some fair one, who had taken this way to show her admiration; for Le Gautier was, like most vain men, a great admirer of the sex, and fully impressed with the all-conquering fascination of his manner. He was not the first clever man who has held such opinions, and found, when too late, the fatal error of underestimating the power of an injured woman.

He perfectly understood the advertisement. It was not the first time that newspapers had been employed to do work for the League; nor did he hesitate to avail himself of this golden opportunity. He had scarcely finished his breakfast and made up his mind to meet the mysterious Eastern Eagle, when Salvarini entered. He was moody and preoccupied, with a sombre frown upon his face, telling of much inward uneasiness.

'I do not like these new arrangements,' he commenced abruptly, in answer to Le Gautier's florid greeting. 'There is great danger in them, and they cannot lead to any good results. I shall oppose them.'

'Pray, explain yourself, my good Luigi; I am in Cimmerian darkness,' Le Gautier replied carelessly. 'You are so dreadfully in earnest; absolutely, you view life through the gloomy spectacles of the League.'

'It is folly, madness!' Salvarini replied passionately. 'Heaven knows, we have had bloodshed enough. What do you think the last proposal is?—Nothing less than the removal of ministers: dynamite is to be the agent, and a special mission entrusted to Rome. Visci—our dear old friend Visci—is doomed!'

'They must be mad,' Le Gautier returned calmly. 'But tell me, Luigi, what of Visci?' he continued, inspired by a sudden thought. 'I presume you have been holding a Council this morning. Visci used to be a friend of yours. How do they propose to get rid of him?'

'The dagger!' Salvarini answered with great agitation. 'Visci was once a friend of mine, as you say, and yours too, for that. Heaven save me from the task!'

'But why need it be you? We have new members, new blood as yet untried. Let them show their mettle now. There is no reason why we should always be in the van of battle. But why this sudden determination?'

'The old story,' Salvarini continued bitterly—'private grudges brought in; personal ends to be served where all should be of one accord, all striving for the good of the cause. I am heart-sick and weary of the whole affair. Is our path always to be defiled with innocent blood?'

'So long as I can keep my hands clean, it is nothing to me,' Le Gautier replied with a careless shrug; 'not that I hold with the present system.—But abandon your Cassandra vein, and be yourself for a moment. See what you think of that, and congratulate me upon a stroke of fortune I have not altogether deserved.'

'I congratulate you,' Salvarini grimly replied,

when he had perused the paragraph. 'You always contrive to fall upon your feet. Did I not tell you that night in the Kursaal you would hear of this again? Of course it is a woman. No man would have taken such trouble, especially if he happened to be a Brother,' he concluded with significant emphasis.

Le Gautier drew his fingers airily across his throat, intending by this little playful action to allude to his own sudden death. In his petty vanity, he was not altogether displeased that his friend should hint at a conquest.

'Undoubtedly from a woman,' he said. 'Mark the mystery and romance underlying it all. Some fair dame of the Order, perhaps, who has seen me only to become a victim to my numberless charms.—Luigi, my friend, this little affair promises amusement.'

'I might have known that,' Salvarini retorted with some little contempt. 'I believe you could be turned aside from the most pressing mission by a glance from a pair of melting eyes.—Bah! your thoughts run on such things to the detriment of the Order.'

'In such a charming situation as you mention, confusion to the Order!—Now, do not look so melodramatic! Pardieu! do you think a man should have no amusements? Now, as a penance, you shall bore me with the order of this morning's proceedings.'

'A woman will ruin you eventually.'—Le Gautier smiled; the sententious words read the wrong way.—'We had not much transaction this morning, save what I have told you, and the initiation of a few members.'

'Converts to the noble cause of freedom.—Any one I know!'

'Several. Do I understand it is your intention to introduce Sir Geoffrey in person?'

Le Gautier nodded assent; and the friends proceeded to discuss other matters connected with their mission. When Salvarini had left, long and earnestly did Le Gautier sit silently there. Then he rose, and taking a pack of cards from a drawer, began to cut and shuffle them rapidly. He dealt them round six times, bringing the knave of clubs on the same heap each time. He put the cards away; an evil smile was on his face.

'My right hand has not lost its cunning,' he muttered. 'Frederick Maxwell shall go to Rome, and— Well, fate will do the rest.'

With this humane remark, he put on his hat, struggled into a pair of very tight-fitting gloves, and passed out from Hunter Street into the Euston Road; for it is almost needless to say that the house beyond Paddington where we last saw him was not his ordinary lodging, his abode being a much humbler one, as consisted with his limited means; for Hector le Gautier, though moving in good society, and always fantastically attired, was not endowed with that wealth that smooths so many paths in this vale of tears. Like other men of his class, he contrived to keep his head above water, though how it was done was alike a mystery to himself and his friends.

It was past two as he turned into Grosvenor Square and up the broad flight of steps which led up to the Charteris' mansion. He had come here with more purposes than one: in the first place, to see Enid—this attraction a powerful one;

and secondly, to have a talk upon general matters with the baronet, and perhaps get an invitation to luncheon. Sir Geoffrey he found in the dining-room, just sitting down to his mid-day meal in solitary state; and in answer to an invitation to join, asked after Enid, who, he learned, had gone with Maxwell and a kindly chaperon to a morning-party at Twickenham. He was, however, too much a cosmopolitan to allow this to interfere with his appetite, so, with a few well-chosen words of regret, he settled himself quietly to his lunch, discussing in turn the weather, politics, the last new beauty, anything—waiting for his host to speak upon the subject nearest his heart. 'Sir Geoffrey's patience being by this time exhausted, he commenced.

'I think I am free, Le Gautier,' he said at length.

The listener affected not to comprehend this enigmatic remark.

'Free from what, Sir Geoffrey?' he asked carelessly. 'Is it gout, or headache, or a marvellous escape from dining with a notorious hore? Which of these things are you free from?'

'I was thinking of nothing so worldly,' was the serious reply. 'I allude to the marvellous manifestations recently vouchsafed to me. Since you so kindly showed me through yourself the path of duty, I have felt like a different man. They are gone, I trust for ever. Tell me, do you think there is any possible chance of their recurring?'

'So long as you fulfil your part of the contract, certainly not.—But, my dear Sir Geoffrey,' the Frenchman continued gaily, 'let us have no serious conversation now, I beseech you. Let us forget for the time we are anything but friends. I am too light and frivolous to talk seriously. The last new play, a fresh picture, anything but the supernatural.'

Despite this appearance of *bonhomie*, Le Gautier had no intention of changing the conversation, though it was not his cue to introduce the subject himself; besides, an appearance of good-naturedly yielding to the other's news seemed to tell better, and create a deeper feeling of obligation.

'The longer I put the matter off, the more difficult my task seems to be,' the baronet continued, not without hesitation. 'Certain restrictions were laid upon me, certain commands given, which I am bound to carry out. If you had heard the conversation, my task would be less difficult; but as you did not, I must do my best to explain.'

Le Gautier drummed with his fingers upon the table, shrugged his shoulders, and sighed gently, as a man yielding against his will upon the sacred ground of friendship, tempered with politeness.

'If you have anything to say, it is perhaps better to say it. But if it pains you, if it gives you the slightest mental agony or discloses family affairs, then, my dear sir, be dumb;' and the speaker glanced out of the window, as if he considered the matter settled.

'But I must tell you. It is impossible I can fulfil my promises without your assistance. In the first place, I am commanded to join your League or Brotherhood; and here, you see, I cannot get any further without your good advice and countenance.'

'You distress me,' Le Gautier replied mournfully. 'I wish that matter could have been settled without such a step being necessary. Our work, though a noble one, is attended at times with great hardship and danger. Think, my dear Sir Geoffrey—think if there is no middle course by which such an action may be avoided.'

The speaker created the impression he was most anxious to make. To the baronet, full of his scheme, this advice was unpalatable, the more that, like most spoilt, weak-minded men, he was intensely fond of his own way. He grew stubborn. Le Gautier was perfectly at ease as he studied the other's face.

'I see no middle course. The injunction was very strict. I dare not disobey, if I would. I must become a member of your League, whatever the danger may be; and if called upon, I must take my part in the work. Do you not remember the vision?'

'You forget my state,' Le Gautier interrupted softly,—that during the time I heard nothing, comprehended nothing going on around me. My faculties for the time being were torpid.'

This adroit interruption only served to increase the baronet's uneasiness. He writhed in his chair, unable to continue.

'And there is another thing,' he stammered, 'which I must tell you, though I scarcely know how. I daresay you have noticed my daughter?'

'Is it possible to see her and not be conscious of her beauties?' Le Gautier cried,—to be in her presence and not feel the charm of her society! Ah! Sir Geoffrey, he continued blandly, throwing out a strong hint, 'he will be a happy man who wins the treasure of her heart!'

At this helping of the lame dog over the stile, Sir Geoffrey looked grateful. 'Has she ever impressed you, Le Gautier?'

'Alas, yes,' was the melancholy reply, but with some feeling too, for, as far as he was concerned, the passion was genuine. 'Why should I strive to conceal my honest love? I may be poor and unknown, but I am at least a gentleman, and I offer the greatest compliment man can pay a woman—an ardent, loving heart.—But I am rambling; I dream, I rave! That I should aspire to an alliance with the House of Chabertis!'

The baronet was somewhat moved by this display of manly emotion, and, moreover, his pride was tickled. The young man evidently knew that what he aspired to was a high honour indeed.

'But, Sir Geoffrey,' he continued brokenly, 'you will not breathe a word of this to a soul! In a moment of passion, I have been led to divulge the master-passion of my life. Promise me you will forget it from this hour,' and saying these words, he stretched out a hand trembling with oppressed emotion to his host and friend. A good actor was lost to an admiring world here.

'But bless me!' Sir Geoffrey exclaimed, taken aback by this display, and, sooth to say, somewhat irritated that the necessary explanation must come from him after all, 'I want you to marry the girl.'

'Is it possible, or am I dreaming?' Le Gautier cried in a delirium of rapture. 'Do I hear aright? Oh, say these words again!'

Le Gautier was slightly overdoing this thing now, and Sir Geoffrey knew it. 'I mean what I say,' he added coldly. 'You are this man for Enid.'

'Who is talking about Enid?' asked a fresh clear voice at that moment, as the subject of discourse, accompanied by her escort, glided into the room. Le Gautier, in love as he was, thought he had never seen her look so fair as she did then, her face slightly tinged with colour, her eyes all aglow with pleasurable excitement. For a moment the conspirators were abashed, and it took all the Frenchman's cool equitahis nerve to solve and explain what appeared to be a truly awkward question.

'When we are not with the rose, we love to talk of her,' he replied with one of these bold glances for which Maxwell longed to kick him on the spot.—'I trust you have spent a pleasant morning?'

Enid answered as coldly as the dictates of breeding would allow. The man's florid compliments were odious to her, and his presence oppressive. Le Gautier, accustomed to read men and faces like open books, did not fail to note this.

'I have important news,' he whispered to Maxwell, after he had made his graceful adieux to Enid and his host. 'I want to say a few words to you, if you happen to be walking my way.'

Maxwell answered with studious politeness. 'With pleasure,' he said. 'If you will allow me, I will drive you in my cab.'

Enid's quick ears caught the whisper, and a feeling of approaching evil seemed to come over her—a cloud passed over the sun, and, to her fancy, for a moment Le Gautier looked like Mephistopheles tempting Faust. As the two men passed out, she called Maxwell back. 'Be careful,' she urged. 'Beware of that man; he will do you a mischief.'

Maxwell smiled down in the pretty fearful face tenderly. 'All right, little woman,' he answered carelessly. 'I shall take care. He is not likely to do any harm to me.'

NAPOLEON IN TOR BAY.

It is all but impossible to realise the scene of excitement which the calm blue waters of Tor Bay, crested with the bright sunshine of the summer of 1815, presented, when the Emperor Napoleon arrived on board the *Bellerophon*, soon to be transferred to the *Northumberland*, in which he was conveyed to St Helena. After the world-earthquake Waterloo, when the allies entered Paris, and the French army declared for Louis XVIII, Napoleon made his way to Rochefort, where he arrived on the 3d of July, and whence his attempts at escape were frustrated by the moonlight and the vigilance of the English cruisers. Two frigates had been placed at his disposal to facilitate his flight to America, and arrangements likewise made with a Danish smack which was to await him out at sea; but to reach her under the circumstances was deemed an attempt too hazardous. At last, on the 14th of July, Count Las Cases and General Allmand came on board the *Bellerophon*, then lying in the Basque Roads, with a proposal to Captain Maitland that he should receive Napoleon, who

desired to proceed to England for the purpose of throwing himself upon the generosity of the Prince Regent. Captain Maitland clearly explained that it was out of his power to grant terms of any sort, and that his instructions only permitted him to convey Napoleon and his attendants to England; on which understanding, the ex-Emperor, with his baggage, embarked the following morning on board a French brig, which conveyed them to the *Bellerophon*, where he was received with the honours due to a crowned head. On gaining the quarter-deck, the Emperor said in French to the captain: 'I am come, sir, to claim the protection of your Prince and of your laws.' In appearance he is described as about five and a half feet in height, strongly made, decidedly stout, with a sallow complexion, and dark-brown hair, as yet untouched with gray. He wore a green uniform coat with epaulets and a red collar, a broad red sash, star on the left breast, white waistcoat, boots and pantaloons, and a large cocked hat with the tricoloured cockade.

The passage, by reason of adverse winds, was slow, so that it was the 24th ere the *Bellerophon* arrived in Tor Bay, when Captain Maitland was signalled to stand out three leagues from shore, and there await further orders from the Admiralty. It is said that on first beholding the Devonshire coast, Napoleon could not conceal his admiration, exclaiming: 'At length here is this beautiful country! How much it resembles Porto Ferrajo, in Elba.'

No sooner was it known that the disturber of the peace of Europe, against whom they had so long and so sternly striven, was actually on board ship at anchor in Tor Bay, than from Dartmouth, Paignton, Dawlish, Teignmouth, and by-and-by from ports more distant still, the country-folk thronged in boats of every size and shape, struggling to approach the *Bellerophon* to catch a glimpse of the fallen Emperor. So inconvenient and dangerous was the crowding of these innumerable craft with their cargoes of sightseers, that it became necessary to order the *Bellerophon's* boats to row round the ship to keep them at a respectful distance. No fewer than a thousand boats daily put off from the shore; and Napoleon exhibited no little pleasure and amusement at the interest excited by his presence. From London and all parts of the country, people flocked down to Tor Bay during the time necessarily occupied in determining Napoleon's final destination, well pleased if they succeeded in catching an occasional glimpse of him as he walked backwards and forwards in the stern gallery with his hands behind him, or surveyed through an opera glass the varied texture of the crowd in the vessels below. As he paced the quarter-deck in conversation with one or other of his followers, he would frequently approach the ship's side and acknowledge the salutations of his visitors. Two or three French ladies, wives of members of the suite, dressed in the height of the prevailing fashion, were frequently seated on deck, with whom, as he paused in his walk and stooped to look through the ports at the vessels alongside, Napoleon would now and again exchange a word. At six o'clock the dinner-bell rang, when the Emperor with his attendants went

below, the sailors with great good-humour putting out a board on which was chalked, 'He's gone to dine.' He usually remained about half an hour, when another board announced his re-appearance on deck. It was about the 1st of August when his ultimate destination became known to him through the newspapers, and he was shortly afterwards observed at the cabin window tearing up papers, which he threw into the sea. Fragments of some of these, being seized upon as relics, turned out to be translations of speeches in the last session of parliament, and a letter addressed to the Empress Maria Louisa immediately after his abdication.

But of all the incidents which occurred while Napoleon was in Tor Bay, the most remarkable was a farewell visit paid him by a lady of foreign appearance and surpassing loveliness. Cloaked and veiled, to escape observation, she carried with her a bouquet of choicest flowers, peculiarly arranged in rows, which, when her boat arrived at a convenient distance from the *Bellerophon*, was despatched in charge of her servant. As the token of unchanged affection reached the quarter-deck, the lady was observed to raise her veil, disclosing features of exceeding beauty. At first, the bouquet seemed to awaken no memories in Napoleon's breast, but after a moment, he hastily approached the ship's side, and steadfastly gazing awhile on the fair form disclosed to view, he waved a last farewell.

On Wednesday the 2d of August, the *Bellerophon* and *Tonnant* sailed for Plymouth, where it had been intended that the transfer to the *Northumberland* should be carried out. But in consequence of the loss of life which occurred from the vast concourse of boats in the Sound, as well as to avoid a writ of habeas corpus, under which it was desired to obtain the evidence of Napoleon in a case at the time pending in the Queen's Bench, it was deemed advisable to return to Tor Bay, where, on Sunday the 6th of August, the three vessels (the *Northumberland* having meantime come round from Portsmouth) cast anchor. No sooner were the ships brought up, than Sir Henry Bunbury, accompanied by Mr Bathurst, proceeded on board the *Bellerophon*, and announced to the ex-Emperor the resolution of the cabinet, that he should be transported to St Helena, accompanied by four of his friends and twelve servants. The information was received without surprise; but in a speech of three-quarters of an hour's duration, delivered in a manner the most impressive, Napoleon protested against the determination which had been arrived at.

The same afternoon, Lord Keith and Sir George Cockburn proceeded in the admiral's yacht to the *Bellerophon*. Napoleon was on deck to receive them. After the usual salutations, Lord Keith addressed himself to Bonaparte, and acquainted him with his intended transfer to the *Northumberland* for passage to St Helena. After much expostulation, Napoleon finally refused to go; but upon Lord Keith expressing the hope that no coercion would be necessary to carry out the orders of government, he replied: 'O no, no! you command, I must obey! Only, recollect, I do not go of my own free-will.' He then formally handed to Lord Keith a written protest against his transportation to St Helena, in which

it was contended, that having come voluntarily on board the *Bellerophon*, he was the guest and not the prisoner of England. 'I appeal,' he concluded, 'to history, whether an enemy who comes deliberately in his misfortunes to seek an asylum under the protection of English law, can give a more convincing proof of his esteem and confidence. But how have the English answered such confidence and magnanimity; they pretended to extend a friendly hand to this enemy; and when he relied on their good faith, they sacrificed him.'

It was afterwards arranged that the transfer should take place the following morning (Monday) about eleven o'clock. Early next day, Sir George Cockburn, superintended the inspection of the baggage, consisting of services and toilet sets of plate, several articles in gold, books, beds, &c., which were sent on board the *Northumberland*, four thousand gold napoleons being sealed up and detained. The baggage having been removed, the parting scene commenced, Napoleon handing to several of his officers a certificate of fidelity and good service. About eleven o'clock, the barge of the *Tonnant* proceeded to the *Bellerophon* to receive the fallen Emperor and those who were to be the partakers of his exile: General and Madame Bertrand with their children, Count and Countess Montholon and child, Count Las Cases, General Gourgaud, nine men and three women servants. At the last moment, Napoleon's surgeon refused to accompany him, whereupon the surgeon of the *Bellerophon*, Mr O'Meara, consented to supply his place. Shortly afterwards O'Meara was offered a salary of five hundred pounds per annum, but this he rejected, with the remark that the pay of his king was sufficient to satisfy him.

Before entering the barge which was to convey him to the *Northumberland*, Bonaparte addressed himself to Captain Maitland and the officers of the *Bellerophon*, not forgetting to take off his hat to them again after descending the ladder into the barge. It was about noon on the 7th of August when the barge of the *Tonnant* approached the starboard side of the *Northumberland*. Bertrand was the first to go over the side, and standing with his hat off, upright as a sentinel, announced his master. Napoleon instantly followed, and taking off his hat, remarked to Sir George Cockburn, who received him: 'Monsieur, je suis à vos ordres.' At once moving forward on the quarter-deck, he desired to be introduced to Captain Ross, who commanded the ship, a ceremony which was immediately performed, the guard of marines, drawn up on the port side, receiving the ex-Emperor with the compliment due to his rank as a general officer. To Lord Lowther and Mr Lyttleton, who stood near the admiral, Napoleon bowed and spoke a few words, remarking also to an artillery officer who was by, that he himself had originally served in that arm. The introduction to the eight lieutenants of the ship, not one of whom could speak a single word of French, was sufficiently ridiculous; they were drawn up in line on one side of the cabin; and after gazing and smiling for a moment on Napoleon, who, in his turn, gazed and smiled at them, they bowed and defiled before him out of the cabin door. The after-cabin on board

the *Northumberland* was not, as on the *Bellerophon*, the private room wherein Napoleon was not to be intruded upon by any unbidden guest, but was shared equally by the admiral and his friends; a small cabin being besides appropriated for the sole accommodation of the ex-Emperor, and elegantly furnished, the toilet being of silver, and the bed linen of exquisite fineness. The party were also permitted to supply themselves from shore with any articles they might desire wherewith to add to their comfort and amusement, a permission of which they availed themselves by purchasing a hilliard-table, an immense supply of playing-cards, chessmen, &c., besides a number of the best books in the English language.

After waiting for the *Weymouth* storeship and some other vessels destined to complete the miniature squadron, the whole finally sailed out of Tor Bay on Friday the 11th of August; and Napoleon passed away from the shores of Europe to end his days in exile on a solitary rock in the Atlantic.

GEORGE HANNAY'S LOVE AFFAIR.

CHAPTER IV.—DISENCHANTMENT.

FORTUNE seemed to smile on Alfred's London enterprise. He called personally on the editors of several of the society magazines and journals. 'A Summer Ramble in Kirkcudbright' was now in all the glory of print; and when he assured the editors that he was really the 'Ariel' who penned the sketch, he found them willing, nay, anxious to look over the manuscripts he left with them. The letter from the *Olympic* accepting the manuscript and inclosing so handsome an honorarium was of great help to him. Mr Hannay had a reputation for 'discovering' talent, and his protégés hardly ever failed in taking some rank in the profession. He got four or five accepted at fairly remunerative prices. Then he was proposed at a minor literary club, and passed the ballot. As a new contributor to the *Olympic*, he ranked well there among his brother scribes, who looked on him as a rising man, and one whose good opinion was worth courting. These new friends indeed treated him with great cordiality, and made him as one of themselves; some even going the length of borrowing from him small sums of money.

Nor was this all. One of the members, the sub-editor of a Sunday paper, volunteered to introduce him to London 'society.' Behold our friend, then, at a grand reception at Mrs Judson's. This lady was the widow of a wealthy London pawnbroker (financial agent she preferred the lost one to be called). Her sole ambition in life was to secure a following of literary 'stars,' even if they were of infinitesimal magnitude; and in her circle 'Ariel' appeared as one of the first. His handsome figure and genial manners constituted him a great favorite with the ladies; and his presence was eagerly sought for at all these little reunions which compose the 'fringe' of London literary and artistic society. He found this kind of life both pleasant and profitable; for he was brought in contact with many editors and proprietors of third and fourth rate periodicals,

and was able to dispose of half his rejected manuscripts among them, with fairly satisfactory pecuniary results to himself.

His hanker now held one or two hundred pounds to his credit, and he began to look upon the success of his literary venture as *un fait accompli*. There was just one little thing that annoyed him: his newly found literary friends were extremely solicitous to know when his further productions would appear in the *Olympic*. This was a poser, for he had not the least idea himself. He got out of the difficulty, however, by saying that the principal editor being on the continent, there would be nothing definitely arranged until his return. As will be remembered, Nan's restrictions did not prevent him from contributing to the *Olympic* in his own name; so, immediately after his arrival in London, he set to work and wrote a sketch called 'Student Life in Brussels.' The manuscript was duly sent, and duly returned in a few days with a printed note indicating the editor's regret at being unable to make use of the paper. This was discouraging; but then he reflected that taste in literary things was very fickle; so he wrote a heavy article on Fair Trade, and sent it on; but the result was the same.

About this time, he heard that Mr Hannay had gone to St Petersburg with a friend to enjoy the winter festivities of the gay northern capital. As he was not expected home for two or three months, Alfred had a good excuse till then for the non-appearance of any further work of his in the *Olympic*. In the meantime he gave himself up to the charming gaieties and pleasant little dissipations of the circle that had made quite a lion of him. He rather liked the homage these people paid him; true, they were mentally his inferiors, he thought; but then they had money, position, and influence, and might be made useful to him in the future. He began to think—sometimes with a feeling bordering on regret—of his engagement to the innkeeper's daughter. How much better he could do now, if he were free! However, he would be true to his engagement. Only, Nan must be reasonable, and wait; at the end of two or three years, when his name was famous and his position thoroughly assured, he would marry her. To do so now would be extremely prejudicial to his interests, and must not be thought of for a moment. O no; she must wait patiently till it suited his convenience; and wouldn't she gladly do so? Of course, for wasn't the girl madly in love with him?

And what about Nan? Well, things were going on in their usual jog-trot course at Lochenhreck. The winter was their dull season, and she had plenty of time at her disposal, which she employed in sewing, reading, practising her music, and occasionally taking part in the quiet social gatherings of her country neighbours. She was, of course, delighted to hear of her lover's success in London. 'Well, after all,' she thought, 'he seems to have known best.' Then she thought smilingly of the time when he would be coming to claim the fulfilment of her promise; and she hoped she could induce him to spend part of the year at least at Lochenhreck. The

parting with her father was the only drawback in her fair future; and she hoped this might be partially at least averted. She sometimes thought of her old and trusted friend the editor, and a shadow would come over her countenance for a moment. It passed quickly away, however, for she never thought but that he had long since forgotten her, amid the gaieties of the continent and his literary pursuits; for though far from London, he still held the editorial reins and wrote his usual articles for the *Olympic*.

This pleasant, tranquil state of matters lasted for some weeks. Her lover still corresponded regularly with her; but his letters began to get shorter, and were, perhaps, not quite so profuse and warm in their amatory expressions. Then after a hit they came more irregularly and seldom. Still Nan paid no heed to what another maiden might have taken as indications of their lover's failing allegiance. Hers was a happy, contented disposition, with no morbid desire to conjure up possible future evils. She loved Alfred sincerely, and with all the warmth and fervour of a girl's first love. That he had failings, her strong, keen sense showed her plainly enough; but then he was only a fallible mortal like herself and other people. She was not blind to the vanity he displayed in writing to her about his social triumphs. If there was anything that troubled her, it was the frequent references he made to Mrs Judson. She resented the control which this woman seemed to have acquired over her lover's doings. True, the widow was almost old enough to be his mother, and had been very kind to him; but a man should have a mind of his own, and hold his future in his own hands; if he did consult with any one, it should be with her who was soon to be his wife.

Things went on in this fashion for some time longer, and Nan began to feel a vague, chilling feeling in her heart that all was not as it should be between Alfred and herself. She was scarcely prepared, however, for a letter she received from him one morning after a longer silence than usual. It was dated from a Sir Hew Crayton's shooting-lodge down in Essex. The high-born though impecunious—and, if the truth must be told, rather disreputable—baronet had been a client of the late Mr Judson, and was heavily indebted to his widow. He was a constant attendant at her house, and it was there Alfred had formed his acquaintance. Nan smiled when she saw the ostentatious way he dated the blazoned note-paper from Crayton Lodge. Before she finished reading, however, her eyebrows became knit, and an angry frown settled on her willow smiling visage. The letter commenced by saying that as he felt rather out of sorts with his protracted course of social enjoyments, he had accepted his friend Sir Hew Crayton's kind invitation to spend a few days' pheasant-shooting with him down in Essex. Then he gave a general account of what he had been doing since he last wrote—the dinner-parties, balls, routs, conversations, and what not he had been at; the compliments that had been paid him, and the pleasing prophecies of the grand future before him which flattering tongues had whispered in his ears. All this she read with an amused smile. But near the end she came to a paragraph which ran as follows: 'Do

you know, Nan, I have got a splendid chance of making my fortune just now! A young lady with twenty thousand pounds in her own right has fallen in love with me! I was introduced to her at an afternoon tea at Mrs Judson's. Of course, I made myself agreeable enough, but I never thought she would have taken my little civilities so seriously. Yet she did so. Mrs Judson gave me a plain hint to that effect, and I then had to tell her about our engagement, and that such a thing was impossible. She was surprised, and advised me strongly to keep the thing secret, as, if it were known, it would damage my prospects greatly in society, and even in my profession. She has an excellent knowledge of the world, Mrs Judson, and has been very kind to me; her idea is, that we should not think of getting married for two or three years yet. By that time I will be in an assured position, able to marry any one I like, and not care a pin what the world says.'

Nan could scarce believe her eyes. Who was this Mrs Judson who had thrust herself between them? And did the prospective 'not caring a pin what the world said about marrying her,' mean that he was afraid and ashamed to marry her now? The very thought brought the hot blood tumultuously to her cheeks. Her impulse was to write breaking off the engagement at once; however, when the first burst of natural indignation was past, her practical good sense asserted itself, and she wrote a short note, requesting him to hasten down to Lochenbrock, as something of the most vital importance to them both had to be at once decided. This she posted, and awaited her lover's arrival—with impatience certainly—but not of a pleasing kind.

When Alfred got the letter, he was a little startled. Justly enough, he attributed it to something he had said in his last epistle to her; and in going over its contents in his mind, he had no difficulty in fixing on the paragraph just quoted as being the cause of offence. 'Poor Nan!' he thought. 'A case of jealousy, I suppose—the twenty-thousand-pounds young lady. How ridiculous of her! Didn't I say the thing was impossible! However, I must run down and see her. A kiss, a caress, and a few soft words, will put her all right. Really, now, I do like Nan; and I'll make things all right for her one of these days. But she must have patience: she forgets what a sacrifice I am making, all for her sake. To marry an innkeeper's daughter! when, I may say, I have the pick and choice of the eligibles of London society, seems like lunacy. Oh, but I'll be true to her, all the same! But she must learn her position; give up any selfish ideas of an early foolish marriage, and learn to wait patiently till it suits my convenience and interest.'

He arrived at Lochenbrock railway station by the morning express. The wagonette was there to meet him, but no Nan. He jumped in; and whirling through the keen frosty air, cracking jokes with the driver the while, he arrived in excellent spirits at the little old-fashioned inn. To Nan's great relief, her father had gone to Castle Douglas market; she hated 'scenes' of any kind and under any circumstances; but she thought she could bear the one before her better, if her father was not present and was never to

hear of it afterwards. After having dined the praises of his prospective son-in-law in his ears for months, how could she now turn round and say she had discovered him to be a vain, conceited, selfish coxcomb? She had little hope of this interview putting matters right between them, and, to be prepared for the worst, had collected all his letters—all the little nicknames he had given her—and parcelled them up ready to hand to him.

She submitted gravely and coldly to the customary salute with which he greeted her, and led the way to the coffee-room, where breakfast lay ready for him. In the occasional presence of the waiting-girl, private conversation was impossible; so he rattled on in an agreeable manner about his experiences in London, giving brilliant sketches of the varied private and public entertainments in which he had participated. Nan listened with lady-like composure, putting in an occasional word; and when the meal was over they retired to the private parlour. They sat down opposite to each other, and then Anne commenced her invective. She pointed out that he had deliberately chosen literature as a profession, and having gained a slight success, was now idling away his time in London, among a set of people who could do him no good, and who were, she thought, but of very doubtful reputation.

'Wrong there, Nan!' he interrupted. 'I admit I don't quite move in the inner circle. Still the people I know seem to have plenty of money, and are respectable enough; and I find them useful. I meet with journalists among them, and have been able to dispose of a good many of my manuscripts. And you would notice I was staying for a few days with Sir Hew Crayton. Now, you know it does a literary man a deal of good—in public estimation—to be taken notice of by a baronet.'

'I am sorry to hear you talking in that way,' she replied sadly, 'for it shows me your vanity has got the better of your good sense. Do you not see it was entirely through your article appearing in the *Olympic* that you got your rejected manuscripts disposed of? As for your baronet, I don't think you need boast of him. He stayed with us for a month, four years ago, and left without paying his bill. Papa made inquiry about him, and found he made a swindling living by lending his name as director to bogus Limited Companies. Likely he would borrow money from you?'

Alfred was forced to admit that he had obliged him with a loan.

'Now, Alfred,' she continued gravely, 'I have decidedly made up my mind that it would be better for us both that our engagement should come to an end. If you continue in the life you are leading, I have no hope for your future; but even if you were successful, I could never marry you.' Doubtless, you would expect me to mix with your new friends; that I could never do—if they are like what you describe them—and certain unhappiness would be the result. It is well for us both I have come to know this in time.'

This was different sort of talk from what he had come to hear. It was tears and entreaties for their immediate union which he had expected.

Still his vanity blinded him to the true import of her words. She had said she never could mix with his new friends; well, it was but proper modesty for her to say that. He would reassure her on that score, and all would be well yet.

'My dear Nan, I think you are talking a little hastily. No doubt you would feel a little awkward among the London ladies at first, but that would soon pass away. And Mrs Judson promised me to chaperon you a bit, and—'

'I wish to hear nothing more, sir, about Mrs Judson,' she answered curtly.

'Well, Nan, she's a good friend of yours. I told her all about our little affair. She said of course it would be a great sacrifice on my part; but she applauded my intention of acting honourably towards you, even although you were only an innkeeper's daughter. Of course, it may be two or three years before!'

'Stop!' she cried, rising to her feet, her lips quivering and her cheeks as pale as death—'stop, sir! I did not send for you here to insult me. Surely I have spoken plainly enough; but your head is so stuffed with selfish vanity, you cannot comprehend me. Our engagement is at an end. Here are all your letters and presents! You'll return mine when you get to London.—Now, go!'

As she said the last words, she drew herself up to her full height and pointed to the door. The action was perhaps a little theatrical; but when he looked at her white set face and flashing eyes, he saw plainly enough that she was acting no part. He fancied he had never seen her looking so handsome before; and he felt a sinking at his heart at the thought of having by his foolish letters and talk lost for ever this woman.

'You—you—are—angry just now, Nan. Do take time to—'

'Go!' she repeated firmly, her hand still pointing to the door. Her face was marble in its inflexibility; he knew his doom was sealed. Making a poor show of indifferent self-possession, he rose and quitted the room.

When he was fairly gone, Nan broke down entirely. Shutting herself up in her bedroom, she made use of the safety-valve provided by nature for her sex, and had a thoroughly good cry. Next morning, she was calm and self-possessed, although her eyes were red and heavy looking. Her cherished idol had crumbled into dust; and it became her, she thought, as a prudent damsel to sweep away the smallest trace of it from her heart.

LONDON CHARITY ORGANISATION SOCIETY.

THE Society for Organising Charitable Relief and Repressing Mendicancy, or, as it is popularly called, the Charity Organisation Society, has for its object the scientific supervision of charity dispensation, in the deep-rooted conviction that slovenly and indiscriminate almsgiving is a most pernicious bane to society, and calculated to foster rather than diminish indigence. Personal inquiry is the keynote of the Society's mode of operation. Trained, experienced, and apt persons—both honorary and paid—exhaustively investigate all cases of indigence brought under the Society's

notice. In each instance, one important point is established at the outset of the investigation, namely, whether the individual concerned must of necessity—through physical or other disability—habitually depend for sustenance upon the resources of others, or whether he or she possesses the latent means of self-support, which may be brought into action—under the fostering influence of personal guidance in moral and material things—after the temporary condition of poverty has been met by the judicious application of charity. Cases of the former description are relegated to the action of the poor-law—therein lying its true function; cases of the latter kind are taken in hand by the Society. But its action is not that of an individual charitable institution concerned merely with the distribution of its own resources. It acts as an intermediary between those who need charity and those who are anxious to devote money to charitable purposes. Hence, in the discharge of its functions, it places itself in connection both with benevolent individuals and benevolent bodies, seeking to secure the best relief for the different cases of destitution which come under its notice and at the same time to prevent 'overlapping' in charity dispensation. Where, however, it finds that a case of destitution cannot effectively be relieved from other sources, the Society brings its own funds into requisition. As to its function of 'repressing mendicancy,' this it discharges by promoting the detection and prosecution of impostors.

And now for a word or two about the mechanism, if we may so call it, of the Society. The organisation consists of a federation of forty district committees—one or more being established in each of the poor-law divisions of London—and of a Central Council, at which every committee is represented. The committees comprise, where it is possible, ministers of religion, guardians of the poor, and representatives of the principal local charities. Their function is to receive, investigate, and deal, according to the general principles of the Society, with all cases of alleged want or distress referred to them; and each is intended to form a common meeting-place—a centre of information and charitable work—for persons in the district desirous of benefiting the poor. The Central Council supervises besides endeavouring to strengthen and consolidate the work of the district committees, taking into consideration, as well, all questions of principle and all matters relating to the general action of the Society. Of course the scene of the Society's main operations is the metropolitan poor-law district; but it is glad to give general assistance, by sending information to agencies outside that area. We may add that the example set by the Society has given birth to many foreign and provincial organisations of identical aims and action.

It may be interesting to glance briefly at the broad method of investigation pursued by the inquiry officers—he they paid or honorary—of the Society. In treating a family, then, the following facts are in the first place arrived at: The ages of the parents; the amount of their earnings at the time of application and previously; the cause of their leaving their last employment; the ages of their children; and whether those children go to school (and if so,

where)—or, if they are employed, what they earn. The previous addresses, with the references of the family, are next learned; and it is ascertained whether they belong to a club or have relatives who ought to assist them. Then inquiry is made as to whether the family have any debts hanging over them; what their rent is; how they are obtaining a living at the time of application; and, finally, how they think they can be thoroughly helped. Subsequently, it is the inquiry officer's duty, among other things, to ascertain for himself the cause of the family's distress, verifying the information they have supplied to him; to search out the best mode of helping; to familiarise himself with the character of the family, and find on whom, if its natural head be weak or incompetent, reliance can be placed to re-establish the family fortunes; and, lastly, to settle what means of future thrift and self-support can be fostered into life.

Did space permit, we should like to give some characteristic examples of instances where the indigent have been raised to a state of independence by the well-advised action of the Society, and tell how the workhouse itself has been made to yield material with which to work so happy a transformation. Some reference, too, would be justified to the numerous special questions in connection with which the Society has seen cause to take action. But we have said enough perhaps to effect our immediate purpose and indicate the nature of the Society and the scope of its operations. A considerable literature has grown around the Charity Organisation Society, and this is accessible to all who visit the central office of the institution, 15 Buckingham Street, Adelphi, London, whither all communications to the Secretary, Mr C. L. Loch, should be addressed.

THE DENSCHMAN'S HAD.

A LEGEND OF SHETLAND.

FROM Widwick to Hermanes the cliffs rise steep and high from a deep ocean, so deep that a large ship might float alongside of the crags without danger of scraping her keel. What would be the fate of such a vessel, if she were carried by the might of that sea against that iron wall, I leave you to imagine. The rocks are broken all along their range by fissures and caves, inaccessible from the land, and scarcely approachable from the sea. He is a bold voyager who brings even a boat to threaten the 'baas' and 'stacks'—submerged rocks and needle-crags—which guard the way to those haunts of sea-fowl and seals. One of the caves is named the Denschman's Had. I ought to explain that a 'had' means the den of a wild beast, his stronghold; and 'Denschman' is 'Dane.'

In old days, Shetland (or Hialtland) was nothing more than a 'had' of vikinger, those pirates of the North who have so often been confounded with the noble sea-kings of Scandinavia; but while the islands belonged to Norway, their inhabitants were under powerful protection, and suffered little inconvenience from the uses to which the sea-rovers turned the sheltered voes and secluded islets. It was only when Scottish rule came in that the vikinger

of Norway and Denmark turned their weapons against their brother-Norsemen of the Shetland Isles. During the times of the Stuarts, Scotland had enough to do to look after itself, far less to extend protection to an outlying dependency that was more plague than profit. Indeed, the Scottish kings and nobles seem to have regarded Hialtland as fair game, and robbed and oppressed the people after as cruel a method as that of the northern pirates. Between the two, those islands had a hot time of it; and the islanders, once a prosperous community, sank into poverty and hopeless serfdom.

About the time of Mary Stuart, the isle of Unst was harassed by a noted viking whose name and lineage were unknown. He and his daring crew were believed to be Danes, and his swift barque—appropriately named the *Erne*—and his stalwart person were familiar to the affrighted eyes of the islanders. When the Denschman swooped upon the isle, its inhabitants fled to the hills and rocks, leaving their homes as spoil for the lawless rover. What else could they do? The enemy were strong, reckless, brave, well armed and well disciplined. The islanders, groaning and disheartened under the yoke of an alien power, were at the mercy of might, and could neither resist nor make treaty; so the Denschman came and went like the fierce bird of prey whose name his vessel bore, and no man dared oppose him.

One midsummer evening, a westerly squall arose which sent the fishing-boats flying to the shelter of their voes and vicks. Those storms rise and fall with tropical rapidity and violence. Six hours after it was at its height, the wind had fallen to an ordinary fresh breeze, the sky was smiling as before, and only the wrathful surf, rolling white and broken under the influence of a changing tide, remained to tell of the tempest. All the boats had returned in safety, and there should have been rejoicing in Unst; but instead, men frowned and women trembled, for the fishers had brought news that the Denschman was on the coast: his well-known sail had been seen hovering beyond the holms of Gloup; he was coming upon the wings of the westerly wind; he would be on the Westing Bicht ere long. There was no landing-place available—with such a heavy sea—on that side of the island; but the Denschman knew what he was about, doubtless. He would scud to the north, fly round the Flugga skerries and Skan, would lay-to, and bide his time till dusk drew down; then he would alight on the eastern shore, and work his wild will upon the defenceless isle. Such had been his tactics aforesaid. The people ran to the high lands of Vaalafel and Patester to mark the Denschman's course, for where he meant to land, there they must not be.

Soon the *Erne* was descried emerging from a mist of spindrift, and bearing swiftly towards Unst, heading straight for the isle, and not—as the folk had supposed—skirting the coast. Did the vikinger mean to bring their vessel to harbour among those crags, where the sea was in such a turmoil? Was the *Erne* a demon-ship that could dare everything and perform such a feat? On he came right before the wind with

a following tide; but when well in the Westing Bight, some experienced seamen affirmed that there must be something wrong aboard, for the *Erne* did not rise on the waves with its usual buoyancy; he seemed to plunge madly forward, as if in fierce conflict with the ocean he had ruled so long. By-and-by it was seen that the vessel laboured more and more, yet carried full sail, as if on speed depended salvation.

'I would not say but he's sprung a leak, or the like,' said an old idaller among the on-lookers. 'Who but a madman would bring a ship in-shore like yon, if all was tant aboard!'

'That is so,' remarked a seaman. 'Without doubt, he's in straits; and he's going to try to heach on the Aire of Widwick. It's his only chance, and a poor one.'

'Pray the powers he may not make the Aire,' replied the old man; 'and I'm thinking,' he added, 'that the powers will hear us. There is something fatal amiss with that evil one. See yon! He's not obeying his helm; he's just driving with wind and tide. He's in a mighty strait, praise the Lord!'

'If he misses the Aire, he'll go in *shallmillens* [the fragments of eggshell] upon the baas of Flubersgerdie,' said a fisherman, with a grim smile; and all cried out: 'Pray the powers it may be so!'

As if the powers thus invoked were ready to prove their immediate willingness to answer the cry of the oppressed, the wind veered more to the west, and carried the disabled ship against the holm of Widwick, a small islet which lies off the creek, and wards from it the full force of the North Atlantic. If the *Erne* had stranded on the holm, some of his crew might have effected a landing there; but that was not the end of the viking's barque; she reeled back from the holm with a gash in her side that was a death-wound indeed, and drifted onwards once more. Now, would she gain the creek? No! In a few moments the *Erne* was carried past the little harbour, where lay the sole chance of deliverance, and then crashed among the rocks of Flubersgerdie.

'Praise to the powers that are above all!' cried the men of Unst, and even gentle-hearted women rejoiced as the Denschman, barque and crew, disappeared among the breakers.

The people returned to their homes, happy in the thought that the rocks of Fatherland had proved able protectors, and that Unst was for ever rid of its most dreaded foe.

Two days and two nights passed. No trace of the storm was left. A boat put off from Widwick with the intention of saving such portions of the *Erne* as would certainly be drifting among the skerries near Flubersgerdie. The men could tell by the state of the tides and the wind exactly where the wreckage was to be found, and they made for the spot, never doubting that some spoil would be there to reward them. As they approached the submerged reef where the *Erne* finished her career, the skipper, alluding to the dreaded Denschman, said: 'Well did he deserve what he met here! Think our isle would give him foothold!—our isle, that he has harried this ten year and more! No, no!'

Scarcely were the words spoken, when one of

the fishermen called out excitedly: 'Lord be about us, men, what's yon?'—and he pointed to a cave situated in the cliff opposite the reef.

All gazed, and were struck dumb, for, on a ledge within the mouth of the heler (cave) stood a man—the man! the Denschman, alive, stalwart, terrible as ever, and braudishing his sword, as if defying mortal to molest him.

The boat was instantly hacked, and when the islanders had put what they considered 'a safe distance between themselves and their dreaded foeinan, the men consulted together. Should they make a bold attack? The Denschman was alone; they were six in number. Surely, they could overpower him, tired and despairing as he must be. Yes. But one, or even two of their number were likely to fall before his sword ere he could be conquered. Who was patriot enough 'to lead such dire attack?' No one of that crew! Then should they leave him to die of exhaustion, as he must ere long? There was no way of escape. The lofty precipice overhanging the cave, precluding any scheme of climbing upwards; on either side, the *aiguille* crags rose from a seething depth of sea; in front, a reef of sunken rocks covered with fretful surf, dared the bravest swimmer that ever breasted waves to pass alive.

The Denschman had evidently reached his present refuge by aid of a large plank belonging to the *Erne*, which still floated near the cave. When they had recovered every vestige of the wreck which floated, he could not escape. It was beyond the power of man to leave that cave unaided from without. Help must come from ropes lowered from the land above, or boats brought to the cave. And who was there in Unst would bring rope or boat to aid the Denschman? None!

'Let him die the death!' said the men whose homes the viking had devastated. So they ventured nearer, and removed every floating spar or plank, then returned to Widwick; and it was told in the isle that the Denschman had survived his barque and crew only to meet a more terrible death. No man pitied him; no man dreamt of giving him succour. Those were days when the gentler feelings had little part in men's warfare, and no red cross of healing followed battle ensigns to the field of fight.

Next day, a number of boats put off, that men might feast their eyes on the dead or dying viking; and many saw him. That day, he was seated on the ledge of rock glowering at them; but he made no sign of either submission or defiance. 'He grows weak,' they said, and wondered that even the Denschman's tough and giant frame had so long withstood the exposure and starvation.

A third time the islanders sought the rocks of Flubersgerdie and saw the pirate chief as before. Then they began to fear, and to say that he must be allied to potent powers of evil; for how, otherwise, could he have survived there so long? The interior of the heler could be seen from a little distance: no food or clothing had been saved from the wreck to be secreted there. The prisoner was always seen sitting on the cold bare ledge where he had been first discovered, and the people were satisfied that the cave held no means of sustenance.

Day by day for a whole fortnight boats were guided to Flübersgerdie, and men gazed in awe, but did not venture to molest the Denschman, who merely returned their stare with haughty glances, and never deigned to bespeak their compassion. Dread of the supernatural added its paralysing effects to the terror which the viking's fame had implanted, and there was not a man found brave enough to attack the Denschman in his 'arab.'

Then heaviness fell on the men's spirits, for wives and mothers upbraided them as cowards; their little ones shrieked and hid their faces when it was told that the bugbear of their dreams was making his 'had' in an Unst helyer; and at last, driven by shame and a remnant of manly courage, the islanders determined on attacking their enemy. They would discover if he were immortal; they would prove if the powers of evil were above those of good.

A fleet of boats was got ready, laden with sharp stones, which were to be cast at the foe—a safe mode of onslaught! The islanders armed themselves with staves and axes. Nets were prepared, in whose toils the Denschman should fall if he, by any strange chance, came to close quarters. The oldest uddaler in the isle ordered his best boat to be launched and consecrated, to lead the attack. A day was fixed upon. It had been ascertained on the previous evening that the Denschman was still in his 'had,' alive and strong. No one doubted by that time that there he would remain while the island remained, if not ousted by force and the help of holy powers; or if not aided by demons to rise and blight the isle.

'Pray,' said the old uddaler to his three fair daughters, who stood to see him embark in the consecrated boat—'pray that I bring the Denschman's dishonoured corpse back with me.'

'We will pray,' said the golden-haired maidens.

But what consternation there was on the Aire of Widwick, a few minutes later, when it was found that the old man's boat—the largest and best in the isle, the skiff that was to have led the attack—had disappeared! She had not sunk into the pellucid water, else she had been easily recovered; she had not floated out to sea, for the tide was running landwards; yet she had gone as completely as if she had owned feet to carry her over earth, or wings to fly through air. To be sure, the boat had both feet and wings of a kind, but these were of use on the ocean alone. And she was gone—ears and sails too! Doubtless, her flight had been on her native element; but some man's hand must have spread her wings or moved her feet. Then who had stolen the uddaler's boat? No Hialtlander, be sure! Robbery was never the vice of those islanders; moreover, such a theft could have been brought home to a native easily.

One fisherman, more acute than his neighbours, whispered: 'None but the Denschman has done this; and with common assent, all echoed: 'The Denschman has done this.'

Boats instantly put off and sped to Flübersgerdie, where confirmation of those suspicions was not wanting. The Denschman was no longer in the cave. He had been there, hale and terrible, on the previous evening; he had vanished that morning, and left no trace behind. 'It must

have been the Evil One himself,' said the folk; and there was gloom in the isle, trembling, and much fear, for all expected that ere long the Denschman would descend upon Unst, and, fired by revenge, deal worse havoc than even that of former days.

But days and weeks went past, and nothing further was known of the Denschman or the uddaler's boat, and still the people feared their ancient foe and looked for his return. None doubted that he survived. The man who could live in unabated vigour through a fortnight without food or fire in a dark ocean cave, who could find means of leaving his prison, and could spirit away a large boat—such a one was not likely to have perished on the sea. Yes, without doubt, the Denschman would return to Unst; 'and heaven help us when he comes!' said the islanders.

Then it happened one autumn afternoon that a stranger vessel was seen, on the Westing Bight, making tacks for the isle. The people had always cause to suspect an unknown sail, and they watched the stranger's approach with some fear. As he drew nearer, it was observed that he closely resembled the *Erne* of old, but carried the white flag of peace. The Norland pirates ever scorned to conceal their true character, which was never a treacherous one, but flaunted their ruthless blood-red colours in the face of day. If a viking hoisted the white banner, he meant peace; and so well was this known, and so thoroughly could all men trust in the good faith of a viking, that the islanders instantly sent off a boat to the vessel, though they suspected it was a pirate ship. The stranger had a boat in tow, and when the islanders came near, he lay-to and allowed them to come alongside of his convoy. What was the fishermen's astonishment to find that the boat was no other than that of the Unst uddaler!

Then a stern voice spoke from the ship. 'Come not nearer,' it said, in a patois half-Danish, half-English, which the Hialtlanders could interpret well enough. 'Come not nearer; but undo the tow-line, and take that boat to its owner. It is freighted with goodly gifts for the uddaler's three fair daughters, who will know whence those tokens come.—And know, ye binds of Unst, that ye owe your lives and all that makes life precious to the golden-haired maidens.—Begone!' Then the speaker—easily recognised as the Denschman—made imperious sign to his mariners, who speedily put the vessel on another tack, and before many minutes he was running out to sea again.

The islanders towed the laden boat ashore, where a throng was waiting their return. Numerous questions were asked, numerous conjectures made. The uddaler and his daughters were summoned and the precious cargo displayed. Table utensils of silver, personal ornaments of gold, silken stuffs and snowy linens, rich wines and fruits, and precious grain, whatever could please feminine taste, were spread before the wondering people, while the three sisters stood mute and blushing, now covering with strange shame, anon glancing with curious pride at all around.

Presently, their old father addressed them in

grave and troubled tones: 'Tell us the meaning of this strange *gidie* [riddle].'

At that, the two younger girls fell on their knees and clasped his hands entreatingly, while the eldest sister cried: 'O father, do not be angered, and I will tell ye all. We heard you speak of the Denschman in his sore strait with nobody to pity him. It's true he had dealt cruelly by our isle; hut—hut, O father, it lay heavy on our hearts that a man—and such a man, with such a goodly presence and such a bold spirit—should die like an otter trapped in a snare; and so, we—went to the rock in the dark hour of night, and we lowered a *keachie* [basket] to him with food and cordials and clothes—everything to keep in life. And then—when we knew that our men meant to stone the poor defenceless captive to death, our souls were melted with pity; so we took the boat and helped him to escape. *We* were not afraid of the Denschman; and, truth to tell, he can be kind and gentle like other men. Or ere he left the isle—all in the mirk hour—he promised that, because of what we had done, he would never harry Unst again. No doubt, it was wrong of us, father; but then, oh, be mindful that the plight he was in could not fail to touch lassies' hearts. And if good instead of harm come of it—nays *has* come of it—ye need not trouble yourself more, but forgive us, and trust the Denschman to keep his word. He will do so. We all know that a viking stands to his promise, whate'er betide.'

'The lass has spoken words of wisdom,' said a prudent matron, eyeing the viking's royal gifts; and a laughing seaman added: 'Ay, and what would come of us poor men if lassies were not pitiful, and not just altogether wise at times!'

So the old ndaler forgave his daughters, and—as legend says—after that Unst was often benefited, and never more harried, by the Denschman, whose 'had' is still pointed out by the inquiring stranger.

AN ELECTRICAL FURNACE.

Some of the enormous power which runs waste at the Falls of Niagara is about to be utilised at last, and, strangely enough, the first work required of the water will be the smelting of refractory ores. This new undertaking is to be carried out by the Cowles Electrical Furnace Company, the inventors of the process being Messrs Eugene H. and Alfred H. Cowles. Their experimental works at Cleveland, Ohio, have been so successful, that they were awarded the John Scott premium and the Elliot Cresson medal of the Franklin Institute. While labouring under various disadvantages, the Company was yet able to produce metallic combinations that promise to be of great importance, such as aluminium bronze, aluminium silver, aluminium brass, and silicon bronze in ingots, castings, wire, and rolled metal. Some of these alloys were manufactured into different articles in every-day use. They exhibited screws of aluminium brass; knives with blades of aluminium silver, and handles of aluminium bronze; together with a number of other manufactured articles. Aluminium bronze is stronger than steel, is not so liable to rust,

and, being elastic and ductile, if it can be produced at a cheap enough rate, it should have a great future before it. For instance, cycles made of it would be lighter, stronger, and more easily kept clean than those made of steel. This industry alone should create a large demand. Silicon bronze, also, from its electric conductivity, tensile strength, lightness, and non-corrosiveness, will be a desirable substitute for iron and copper in telegraphy; while aluminium silver—an alloy containing the special bronze with nickel—will be serviceable for cutlery and fancy articles. Pure aluminium, however, has this great disadvantage, that it tarnishes readily, and unless something can be done to remedy the defect, its usefulness will be considerably restricted. At the same time, these alloys bid fair to supplant steel and other metals in the manufacture of light articles where strength and appearance are desirable.

A dynamo larger than any yet constructed is at present being made for the Company at Lockport, New York. As already stated, it will be driven by water, acting on turbines. The contemplated works will, it is estimated, yield about three hundred thousand horse-power, and this only represents a fraction of the power that is running to waste at Niagara.

WHO KNOWS?

I GRANT her fair, ay, passing fair,
As lovely as a budding rose;
But is there soul behind that face,
A beauty 'neath that outward grace?
Who knows—who knows!

Does light of love beam from those eyes?—
The love that in her bosom glows?
Or is the light that lingers there
Delusive, though it shine so fair?
Who knows—who knows!

Does that fair form a fairer charm,
A tender, loving heart inclose?
A heart whose tendrils, like the vine,
Would round the heart that loved it twine?
Who knows—who knows!

And should life's sky be overcast,
And gathering clouds around thee close,
Should fortune frown and false friends flee,
Would that heart still cling close to thee?
Who knows—who knows!

Or is she, can she ever be,
As fickle as the wind that blows,
And veers as if it were at play,
Trifling with all who own her away?
Who knows—who knows!

But why a prey to doubt remain?
Why halt 'twixt hope and fear?—propose.
She may be waiting till you dare,
To crown with love that beauty rare.
Who knows—who knows!

THE MATTERHORN, AND ITS VICTIMS.

THE MATTERHORN, or Mont Cervin, a peak of the Pennine Alps, fourteen thousand seven hundred and eighty feet high, is unique amongst the mountains of the Alps, for elsewhere throughout their length and breadth there is no single peak that approaches to it in massive grandeur of shape. Standing alone, apart from the neighbouring peaks, holding itself proudly aloof, as it were, from the common herd, it is truly a monarch among mountains. To look upon it is to realise at once the feeling of awe and reverence with which, even to this day, the peasants of the valley regard it—a feeling which in former years had perhaps more to do with its reputed inaccessibility than anything else; whilst other peaks whose ascent is now thought to be more difficult, were falling one by one before the early pioneers of the Alpine Club. In that time—with very few exceptions—even the boldest hunters of Zermatt and the Val Touranche shrank from attempting the ascent, for time-honoured legends said that the Matterhorn was haunted, that evil spirits made it their trysting-place; and when the storm raged high, and the lightning played about its crags, danced and shrieked around it in unholy glee. Then, too, the Matterhorn has a history of its own, such as no other mountain save Mont Blanc possesses.

Every one who has read Mr Whympers *Serambles amongst the Alps*—a book which has probably done more to stimulate the love of climbing than any written before or since—knows how he alone—when other mountaineers tried and failed, coming back always with the same tale, that the summit was inaccessible—persisted that it could be reached; and how, though driven back many and many a time, he refused to accept defeat, till at length, after an expenditure of time and money which some would deem completely thrown away in such a cause,

his indomitable perseverance met with its due reward. As Mr Whympers's adventures in connection with the ascent of the Matterhorn have been already related in this *Journal* under the title 'Ascent of the Matterhorn,' January 10, 1880, we need only refer to them here in so far as is necessary for the sequence of this narrative.

There were several attempts made to ascend the Matterhorn previous to 1858; but the first known were those of the four Val Touranche guides—Jean Antoine Carrel, J. J. Carrel, Victor Carrel, Gabriel Maquignaz, with the Abbé Gorret, in that and in the following year. These attempts were all made on the Italian side, from Breuil; and it does not appear that at any time a greater height than twelve thousand six hundred and fifty feet was attained. Very little definite information, however, has ever been obtainable on the subject.

The next attempt of which we have record was a remarkable one, for it was made by three brothers, the Messrs Parker of Liverpool, *and without guides*. The attempt was made in 1860 from Zermatt, and these daring climbers attacked the eastern face, looked upon at that time as quite beyond the powers of any human being to climb. They succeeded in ascending to a height of some twelve thousand feet, and were then driven back by bad weather. In the same year, another attempt was made from Breuil by Professor Tyndall and Mr Vaughan Hawkins, with the guides J. J. Carrel and Bennen; but they did not make much advance upon what had been done during the attempts of the Val Touranche guides; and it is doubtful if a greater height than thirteen thousand feet was reached.

In 1861, the Messrs Parker tried again, but did not succeed in getting much higher than they did in the previous year; while on the Italian side, the two Carrels, J. A. and J. J., made another attempt, which was unsuccessful.

Then began the attempts of Mr Whympers, and from that moment until the last successful expedition, with two exceptions, his name was associated with all the attempts that were made

upon the mountain. The two exceptions were those of Mr T. S. Kennedy and of Professor Tyndall in 1862. The first was unique, as having been made in the winter—on the 7th of January. Mr Kennedy seems to have thought that the ascent might prove practicable in winter, if not in summer; but his experience was a severe one. A fierce wind, bitter cold, and a superabundance of snow, prevented his getting very far; and, like all the rest, he returned completely discomfited. The attempt of Professor Tyndall on the Italian side, in July of that year, was perhaps the nearest to success of any that had yet been made. He had two celebrated Swiss guides with him, Bennen and Walter; and he also took, but only as porters, three Val Tournanche men, of whom J. A. Carrel was one. This expedition was only stopped when within eight hundred feet of the top. Professor Tyndall came back so deeply impressed with the difficulties surrounding the ascent, that he made no effort to renew his attempt. In fact, he does not appear to have gone on the mountain again till he ascended it in 1868, three years after the first ascent had been made. Professor Tyndall's want of success appears in great measure to have been due to the jealousy existing between the guides of the two rival nationalities, Swiss and Italian.

The first attempt by Mr Whymper was made from Breuil on the 29th of August 1861, the same day as the attempt by the two Carrels. Mr Whymper was accompanied by an Oberland guide, who proved a somewhat inefficient companion; and they failed to get higher than the 'Chimney,' twelve thousand six hundred and fifty feet above the sea-level. He made other five attempts in 1862, one in 1863, and two in 1865. In the ninth and last, he was successful.

In Mr Whymper's ninth and successful attempt the united party consisted of Lord Francis Douglas, Mr Hudson, Mr Hadow—a friend of Mr Hudson's—and the guides Michel Croz and the two Taugwalders, father and son. They started from Zermatt on July 13, 1865, and camped out above the Hurlli ridge. The weather was fine and with everything in their favour, next day, they climbed with ease the apparently inaccessible precipices, and reached the actual summit at 14,400 ft.

In the account of the expedition which Mr Whymper has given to the world, he graphically describes the wild delight which they all felt at a success so much beyond their hopes, and how for a full hour they sat drinking in the sweets of victory before preparing to descend. It is almost needless to re-tell a story which we have previously related, and which is so well known as the terrible tragedy which took place during the descent—how Mr Hadow slipped, struck Croz from his steps, and dragged down Mr Hudson and Lord Francis Douglas; how the rope snapped midway between Lord Francis

Douglas and old Taugwalder; and how Mr Whymper and the two Taugwalders watched, horrified, whilst their unfortunate companions slid rapidly downwards, spreading out their hands in a vain endeavour to save themselves, till they finally disappeared over the edge of the precipice, falling a distance of four thousand feet on to the glacier below! The bodies of Messrs Hudson, Hadow, and Croz were subsequently recovered, and now lie buried in the graveyard of the Zermatt village church; but of Lord Francis Douglas, nothing could be seen. Beyond a boot, a pair of gloves, and the torn and bloodstained sleeve of a coat, no trace of him has ever since been found. What became of his body is to this day a mystery.

It is strange how the memory of this the most dramatic—if it may be so termed—of all the accidents which have ever happened in the Alps is still indelibly impressed on the minds of climbers, guides, and amateurs alike. It is the commonest thing to hear it discussed, and the theories put forward as to the cause of the rope giving way where it did are various and ingenious. Unfortunately for the reputation of old Taugwalder, the report of the official investigation held by the local authorities after the accident has never to this day been made public. As a consequence, old Taugwalder has suffered irretrievably from a report mischievously circulated by his fellow-villagers to the effect, that at the moment of the slip, he sacrificed his companions to save himself, by severing the rope! And in spite of Mr Whymper's assertions that the thing was impossible, there are some who still persist in maintaining that he cut it. The suspicion under which he laboured so preyed upon his spirits that he quitted the scene, and for many years never returned to his native village. The younger Taugwalder became one of the leading guides of the valley.

Thrice again has the Matterhorn been the scene of death in a terrible form. In 1879, the mountain claimed two more victims. In the one case, an American, Dr Moseley, disregarding the most ordinary precautions, slipped and perished horribly, falling a height of some two thousand feet, on to some rocks a little way down the Furggen Glacier. Dr Moseley, accompanied by Mr Craven and the well-known Oberland guides, Christian Inabnit and Peter Rubi, left Zermatt on the night of August 13, with the intention of making a one-day ascent of the Matterhorn. Both gentlemen were members of the Alpine Club, and mountaineers of considerable experience. The summit was reached successfully at nine o'clock on the morning of the 14th; and after a short halt, the descent was commenced. Dr Moseley, who was a skilful rock-climber, and possessed of great confidence in his own climbing powers, soon after passing the most difficult bit of the mountain, complained that the rope was a considerable hindrance; and notwithstanding the remonstrances of Mr Craven and the guides, insisted on detaching himself

from the other members of the party. At some little distance from the old hut, the party had to cross a projecting ledge of smooth rock. Rnbi crossed first, and planted his axe so as to give Dr Moseley a firm foothold; but Dr Moseley, declining the proffered assistance, placed his hand upon the rock and endeavoured to vault over it. In an instant, his foot slipped, his axe flew out of his hand, and he fell on to some snow beneath, down which he commenced to slide on his back. The snow was frozen, and he dropped on to some rocks below. With a desperate effort, he turned himself round and tried to grasp the rocks with his hands; but the impetus attained was too great, and he fell from rock to rock till lost to his companions' sight. The body was subsequently recovered; and from the terrible nature of the fall, death must have ensued long before the bottom was reached.

Here was a case of a valuable life absolutely thrown away, for, had Dr Moseley remained on the rope, the accident would never have happened. It was the same over-confidence that cost the life of the Rev. J. M. Elliott on the Schreckhorn, and it is to be feared will cost the lives of others yet, if the warning conveyed by the fall of these two accomplished mountaineers continues to be disregarded. There was another circumstance, too, which had a bearing on the accident, and which is an additional proof of a want of carefulness on the part of the unfortunate man—his boots were found, on examination, to be almost entirely devoid of nails, and were, therefore, practically useless for mountaineering purposes.

In the other case, a death occurred under circumstances which are happily without a parallel in the annals of mountaineering. Two members of the Basle section of the Swiss Alpine Club—a body in no way connected with our own Alpine Club—engaged three guides—J. M. Lochmatter and Joseph Brantschen, both of St Nicolas, and P. Beytrison of Evolena—to take them over the Matterhorn from Breuil to Zermatt. They left the first-named place on the morning of August 12, and in the afternoon reached the hut which the Italian Alpine Club have built at an elevation of some thirteen thousand feet, amidst the wildest crags of the Matterhorn, intending to sleep there, and cross the mountain to Zermatt in the course of the following day. During the night, the guide Brantschen was taken ill, and by morning had become so weak as to be quite unable to move. Now, under these circumstances, it might have been supposed that Brantschen would have been the first consideration; but the two Swiss gentlemen thought otherwise. Instead of at once abandoning the expedition, and sending down for help to Breuil, after a brief consultation they announced to Lochmatter their intention of proceeding to Zermatt, and ordered him and Beytrison to get ready to start. They were conscious of the fact that Brantschen had become dangerously ill, and appear to have demurred at first, but weakly gave in on their employers insisting. A blanket was thrown over the sick man, a little food placed beside him, and then the party filed out of the hut, and the door was shut. It is possible that in their leaving Brantschen they were scarcely alive to the con-

sequences of their act; it is to be hoped, at all events, that they were not; but from the moment that the hut was left, they deliberately condemned the sick man to at least thirty-six hours of absolute solitude. In fact, by the adoption of this course, the nearest succour—at the pace of the party—was nineteen and a half hours off, whereas Breuil would have been only eight. They crossed the mountain safely, but being bad walkers, did not reach Zernatt till half-past one the following morning. They then caused a relief party of guides to be sent out; but it was too late. On reaching the hut, the unfortunate man was found to be dead. The conduct of his employers did not escape criticism both at home and abroad.

There have been accidents on the Matterhorn since 1879; but although in more than one instance there has been a narrow escape, only once has any further life been sacrificed.

Within a few days of the first ascent of the Matterhorn, on July 18, 1865, J. A. Carrel and Bich succeeded in reaching the summit from the Italian side, by a feat of rock-climbing scarcely equalled for daring in the annals of mountaineering. Since then, ascents of the Matterhorn have multiplied year by year; but for every one ascent by the Italian route, there must be twenty at least by the Zernatt. In fact, the former route is scarcely adapted for any but good mountaineers. The Matterhorn has also been climbed from the Zuntt side; but this route has never become popular. The first traveller to ascend the Matterhorn from Breuil was Mr F. Crauford Grove, the present President of the Alpine Club; and of other remarkable ascents may be mentioned those of Miss Walker, accompanied by her brother and Mr Gardiner—Miss Walker being the first lady to climb the Matterhorn—of the Misses Pigeon, who were weather-bound for three days in the hut on the Italian side; and in descending to Zermatt, after crossing the summit, were benighted, and had to remain on the open mountain-side till daylight; of Messrs Cawood, Colgrove, and Cust, who made the ascent from Zermatt without guides; of the ill-fated expeditions in which the lives of Dr Moseley, the guide Brantschen, and Mr Borekhardt were lost; and of Mr Mummery and the late Mr Penhall, who each discovered a new route from the Zuntt side.

The Matterhorn has likewise been ascended in the winter; as the writer can assert from experience, having accomplished the feat—such as it was—in the days when it had not become the everyday affair that it is now. With two guides, one of whom was the well-known Joseph Imboden of St Nicolas, I arrived at Zernatt one fine afternoon in August, resolved upon a one-day ascent of the Matterhorn. A start was to be made at midnight; and soon after that hour, we were picking our way over the stones, which paved the deserted village street in the darkness of a moonless night. Leaving the village behind us, we commenced to ascend through the meadows beyond the village, Imboden leading, and never for a moment pausing, although, in that uncertain light, it was difficult to distinguish a track of any kind. We reached the barren Hörnli Ridge, and as we commenced to traverse it, the sky grew lighter with the dawn of day. We were

close, to the foot of the Matterhorn now, and it loomed upon us, towering high into the sky, and seeming to my eyes one mighty series of precipices from base to summit. There was a solemn grandeur about the scene which seemed even to have its influence upon my companion, for not a word was spoken as we strode on towards the mountain. But when once we were upon the rock itself, I found that the difficulties which I had pictured to myself as likely to arise had little existence in fact; the series of precipices resolved themselves into a rocky surface, much broken, and yielding capital hand and foot bold everywhere. The incline, too, was very much less steep than it had appeared at a distance. No difficulty indeed presented itself, and climbing upwards rapidly, in two hours from the Hörnli we were at the hut which in those days was generally made use of for passing the night previous to an ascent. This hut is built beneath the shelter of an overhanging cliff, on a narrow rock platform, and its position does not give one an idea of security. It is cramped, and when I saw it, was very dirty, and indeed looked altogether so uninviting, that I congratulated myself on having avoided a night in it. We found the stove useful, though, for cooking our breakfast. This hut has now been superseded by a larger building, erected lower down the mountain. We finished our breakfast, and set out once more.

Hitherto, the work had been quite easy; but now came something stiffer, our first experience being on an ice-slope at an angle of perhaps forty-five degrees, overhanging the route by which we had ascended, and by which, had any false step been made, we should have returned somewhat hastily. A party that had gone up the day before spared us any step-cutting, for they had done their work so satisfactorily that quite a staircase remained for our use. We reached the top of the slope in safety; a knife-edge of snow led us to the right, and almost immediately we found ourselves upon the most difficult bit of the mountain, the northern face. Rounding the edge of the mountain, you look down, and below you, the face of the cliff falls away steeply, till it terminates in a drop of three thousand feet or more. Above, rises perpendicularly almost a succession of knobs of rock, overlapping one another, and more or less coated with snow and ice. The position may be rendered exciting enough to please any one by the addition of one or two incompetent individuals to the party.

Our progress was slow but steady. Imboden would scan the face of the cliff, climb up a few feet, and when firmly fixed, call to me to follow, the operation then being repeated with the second guide. We sighted the summit at fifteen minutes past eight; and in less than two hours after leaving the hut we were on the highest point. The summit varies much, differing in shape with each successive season; and when we were there, it was a ridge of snow, narrow in places, broader in others, though nowhere was it possible to walk three abreast. We had a glorious view; but in this respect the Matterhorn is perhaps inferior to some of its neighbours, notably to Monte Rosa and the Dom.

During the descent, Imboden exercised even

greater care, and we reached the hut again safely. From there, we made our way leisurely down to Zermatt, where we arrived soon after three o'clock in the afternoon, after an unusually quick ascent, thanks to the splendid weather and the easy state of the northern face, which, while it cost us only two hours, has sometimes given a party seven hours or more of hard work. On the way down, Imboden pointed out to me two blanché fragments of rope trailing from the rocks far up on the northern face. They were left there by Mr Whytup after the accident, and marked the spot close by where it occurred. There they remained as cherished relics till last year, when a traveller sent his guide to cut them down and bring them away. It is sad to think that it was an Englishman who was guilty of this wanton act.

As far as the actual ascent of the Matterhorn goes, it is far from being the formidable affair which it was once considered to be; but at the same time it is certainly not an expedition to be recommended to every one. It is not that the ascent is dangerous in itself, though some may have their own opinion about that, but it cannot be too strongly insisted on that, under certain conditions, it ought not to be attempted. Every experienced climber knows how weather can affect a mountain, and how ascents which, under ordinary conditions, are easy enough, are apt after bad weather to become difficult—sometimes impossible; and for a party of novices, with possibly guides not of the best class, to attempt the Matterhorn in a bad state is to run a risk such as no one in the pursuit of pleasure is justified in running.

The latest accident upon the Matterhorn, up to date of writing, has perhaps more than any other Alpine accident illustrated the folly of attempting great mountains without a proper mountaineering training beforehand. On the morning of the 17th of August, at three A.M., a party, consisting of Messrs F. C. Borchhardt and T. Davies, with Zermatt guides, Peter Aufsenblatten and Fridolin Kronig, left the lower Matterhorn hut, and in fine weather reached the summit about nine A.M. Soon after leaving it, the weather, with one of those sudden elangues which must always more or less constitute a danger in Alpine climbing, became very bad, and it began to snow. The progress of the party was very slow, for neither of the two gentlemen seems to have been a good walker, and both were exhausted; and by seven o'clock that same evening they had only reached the spot near where Dr Mosley made his fatal slip. Here they halted. It continued to snow all that night and till past noon on the following day, by which time travellers and guides were reduced to a pitiable condition. And now comes the saddest part of the story. Of the party, Mr Borchhardt was by this time the most helpless, and as such, ought to have received the greatest consideration; but the guides persuaded Mr Davies that the only chance of saving their own lives was to leave their helpless companion, and make a push to the nearest point whence help could be obtained. At that moment, it so happened that a rescue party was on its way from Zermatt, and they met it about half-way down to the hut. On hearing of the abandonment of Mr Borchhardt on the

open mountain-side, the relief party pushed on to his aid with all haste; but it was of no avail; they only arrived to find that the unfortunate gentleman was past all human help.

BY ORDER OF THE LEAGUE.

CHAPTER X.

DISDOL the consolation of recovering the precious insignia, the spice of romance in the affair appealed to Le Gautier's natural sentiment. He might, it may be thought, have had something similar made; but it must be remembered that he had no fac-simile in his possession; and he knew, or suspected, that the coin bore private mark-known only to the Supreme Three. At all hazards, therefore, the device must be recovered, and perhaps a little pleasant pastime enjoyed in addition.

After long cogitation, Le Gautier decided to keep the appointment, and, in accordance with this determination, walked to Charing Cross the following night. He loitered along the broad stone platform for some time till the clock struck nine, idly speculating upon the people hurrying to and fro, and turning over the books and papers on the bookstall. At a few minutes after the hour he looked up at the clock, and then down again, and his heart beat a shade more quickly, for there, standing by the swinging door leading to the first-class waiting-room, was a long cloaked figure, closely veiled. Walking carelessly in the direction, and approaching, he looked at his watch as he muttered: 'Past nine—no sign of the Eastern Eagle.'

By way of answer, the mysterious stranger raised her hand to the clasp of her cloak, and there, in the centre of the fastening, was a gold moldore.

Le Gautier's eyes glistened as he noticed this. 'You wish to see me?' he said at length. 'I must thank you for—'

'If your name is Le Gautier,' she interrupted, 'I do want to say a few words to you.—Am I right, sir?'

Le Gautier bowed, thinking that, if the face matched the voice and figure, he had a treasure here.

'This is no place to discuss this matter. If you can suggest any place where we can hold a few minutes' conversation, I shall be obliged.'

Le Gautier mused a moment; he had a good knowledge of London, but hesitated to take a lady to any place so late. The only suggestion he could make was the Embankment; and apparently this suited his companion, for, bowing her head, she took the proffered arm, walked out from the station, down Villiers Street, and so on to the waterside. Le Gautier noticed how the fingers on his arm trembled, attributing this to natural timidity, never dreaming that the emotion might be a warmer one. He began to feel at home now, and his tongue ran on accordingly. 'Ah! how good of you,' he exclaimed, pressing the arm lying in his own tenderly—'how angelic of you to come to my aid! Tell me how you knew I was so rash, so impetuous!'

'Men who carry their lives in their hands always are,' Isodore replied. 'The story does

not need much telling. I was in the Kursaal at the time, and had my eyes on you. I saw you detach the insignia from your watch-chain; I saw you hand it to a woman to stake; in short, I can put my hand upon it now.'

'My protector, my guardian angel!' Le Gautier cried rapturously; and then, with a sudden prosaic touch, added: 'Have you got it with you?'

Isodore hesitated. If he could only have seen the smile behind the thick dark veil which hid the features so tantalisingly!

'I have not your insignia with me,' she said; 'that I must give you at some future time, not now. Though I am alarmed for you, I cannot but admire your reckless audacity.'

'I thought perhaps you might,' Le Gautier observed in a disappointed tone, and glancing at the clasp of his companion's cloak.

'That is mine,' she explained, noting his eager look. 'I do not part with it so recklessly as you. I, too, am one of you, as you see. Ah, Monsieur Le Gautier, how truly fortunate your treasure fell into a woman's hands!'

'Indeed, yes,' he replied gravely, a little puzzled, nevertheless, by the half-serious, half-mocking tone of these last words. 'And how grateful I am! Pardon me if, in my anxiety, I ask when I may have it?'

'It may be some days yet. It is not in my hands; but be assured that you shall have it. I always keep my promises—in love or war, gratitude or revenge, I never forget.—And now I must leave you.'

'But you will at least tell me the name of my benefactor, and when I shall have the great felicity of seeing her again.'

'If I disclose myself to you, my secret must be respected. Some time, when I know you better, I will tell you more. I live in Vendue Street, Fitzroy Square. You may come and see me any night at ten. You must inquire for Marie St Jean.'

'I will come,' Le Gautier exclaimed, kissing the proffered hand gallantly. 'Nothing save the sternest duty shall keep me from Fitzroy Square.'

'And you will respect my secret? I, too, am on the business of the League. You will guard my secret?'

'On my life!' was the fervid response.—'Good-night, and au revoir.'

'On his life,' Isodore murmured as she walked rapidly away in the direction of the Temple Gardens.

It was a beautiful night, the moon hanging behind Westminster, and throwing a glowing track along the swift rushing river, dancing like molten silver as it turned and switched under the arches of Waterloo. It was getting quiet now, save for the echoing footfall from a few hurrying feet or the shout of voices from the Surfer shore. Soft and subdued came the hoarse murmurs of the distant Strand; but Isodore heeded them not. In imagination, she was standing under the shadow of the grape-vines, the sunny Tiber down at her feet, and a man was at her side. And now the grapes were thorns, the winding Tiber the sullen Thames, and the hero standing by her side, a hero no longer, but a man to be despised—and worse. As she walked along, hazy among the faded rose-leaves of the

past, a hand was laid upon her arm, and Valerie stood before her.

'I thought you were going to walk over me,' she said. 'I knew you would return this way, and came to meet you.—Have you seen him?'

'Yes, I have seen him; and what I have heard, does not alter my feelings. He is cold and vain, callous and unfeeling as ever. And to think I once loved that man, and trusted him! The poor fool thinks he has made another conquest, another captive to his bow and spear. Under cover of my veil, I have been studying his features. It is well he thinks so; it will help me to my revenge.—Valeric, he is going to call upon me to-morrow night at ten o'clock.'

'But consider what a rash thing you are doing. Besides, how is this going to benefit you or injure him? He will boast of it; he will talk of it to his friends, and injure you.'

'Not while I have this,' Isidore cried triumphantly, touching the clasp of her cloak.—'Do not you see how he is within my power? Besides, he can give me some information of the utmost value. They hold a Council to-morrow night; the business is pressing, and a special envoy is to go to Rome. The undertaking will be one of extreme danger. They will draw lots, but the choice will fall upon Frederick Maxwell.'

'How do you know this?' Valerie asked. 'I do not understand your mission; but it seems to me that where every man has a stake at issue, it is his own interest to see the matter conducted fairly.'

'You may think so; but perhaps you will think differently when I tell you that Le Gautier is, for the evening, President of the Council. It does not need a vast amount of discrimination to see how the end will be. Le Gautier is determined to marry this Emil Charteris; and much as she despises him, he will gain his end if he is not crossed.'

'But what are you going to do?' Valerie asked, horrified at the infamous plot. 'You will not allow an innocent man to go to his death like this?'

'I shall not, as you say, allow a good man to be done to death,' Isidore replied with the calmness of perfect conviction. 'The pear is not yet ripe. Le Gautier is not sufficiently hoist with his own petard. This Maxwell will go to Rome; but he will never execute the commission allotted to him; I shall take care of that.—And now, mind you are out of the way, when Le Gautier comes to-morrow night.'

Valerie silently shivered as she turned over the dark plot in her mind. 'Suppose you fail, Isidore,' she suggested—'fail from over-confidence? You speak of the matter as already accomplished, as if you had only to say a thing and it is done. One would think, to hear you, that Frederick Maxwell's safety, my husband's life even, was yours.'

'Yes,' she answered calmly; 'his life is mine. I hold it in the hollow of my hand.'

CHAPTER XI.

In one of those quiet by-thoroughfares between Gray's Inn Road and Holborn stands a hair-dresser's shop. It is a good enough house above stairs, with capacious rooms over the shop;

below, it has its plate-glass windows and the pole typical of the tonsorial talent within; a window decorated with pale waxen beauties, rejoicing in wigs of great luxuriance and splendour of colour; brushes of every shape and design; and cosmétiques from all nations, dubbed with high-sounding names, and warranted to make the baldest scalp resemble the aforesaid beauties, after one or more applications. But the polite proprietor of 'The Cosmopolitan Toilette Club' had something besides hair-cutting to depend upon, for Pierre Ferry's house was the London headquarters of the League.

As he stood behind a customer's chair in the 'saloon' shipping and clapping as barbers, especially if they be foreigners, always will, his restless little black eyes twinkled strangely. Had the customer been a man of observation, he would have noticed one man after another drop in, making a sign to the tonsorial artist, and then passing into an inner room. Salvarini entered presently, accompanied by Frederick Maxwell, both making some sign and passing on. Pierre Ferry looked at the newcomer keenly; but a glance of intelligence satisfied his scruples, and he resumed his occupation. Time went on until Le Gautier arrived, listless and cool, as was his wont, and in his turn passed in, turning to the barber as he shut the door behind him. 'This room is full,' he said; 'we wait no more.'

Ferry bowed gravely, and turning the key in the lock, put the former in his pocket. That was the signal of the assembly being complete. He wished his customer good-night, then closing the door, seated himself, to be on the alert in case of any threatened danger.

As each of the conspirators passed through the shop, they ascended a dark winding staircase into the room above; and at the end of the apartment, a window opened upon another light staircase, for flight in case of danger, and which led into a courtyard, and thence into a back street. The windows looking upon Gray's Inn Road were carefully barred, and the curtains drawn so as to exclude any single ray of light, and talking quietly together were a few grave-looking men, foreigners mostly. Maxwell surveyed the plain-looking apartment, almost bare of furniture, with the exception of a long table covered with green cloth, an inkstand and paper, together with a pack of playing-cards. The artist's scrutiny and speculations were cut short by the entrance of Le Gautier.

To an actor of his stamp, the change of manner from a light-hearted man of the world to a desperate conspirator was easy enough. He had laid aside his air of levity, and appeared now President of the Council to the life—grave, stern, with a touch of hauteur in his gait, his voice deliberate, and his whole manner speaking of earnest determination of purpose. Maxwell could not but admire the man now, and gave him credit at least for sincerity in this thing.

'Gentlemen,' he said, in deep sonorous tones, 'we will commence business, if you please. I shall not detain you long to-night, for I have business of grave importance myself. Will you take your seats?'

The men gathered round the table, drawing up their chairs, Le Gautier at the head, and every eye turned upon him with rapt attention.

From an inside pocket he produced a packet of papers and laid them before him. 'Brothers,' he asked, 'what is our first duty to the League?'

'The removal of tyrants!' came from every throat there in a kind of deep chorus. 'And death to traitors!' added one, low down the hoard.

'You are right, my friend,' Le Gautier continued. 'That is a duty to which none can yield.' 'I hold evidence in my hand that we have a traitor amongst us—not in the room, I mean, but in our camp. Does any Brother here know Visici, the Deputy at Rome?'

The assembly looked one to the other, though without speaking; and Maxwell noted the deathly pallor upon Salvarini's face, wondering what brought it there. The President repeated the question, and looked round again, as if waiting for some one to speak.

'Yes, I know him. He was my friend,' Salvarini observed in melancholy tones. 'Let us hear what his fault is.'

'He is a traitor to the Order,' Le Gautier continued; 'and as such, he must die. His crime is a heavy one,' he went on, looking keenly at Maxwell; 'he has refused to obey a mandate of the Throat.'

'Death!' shouted the voices in chorus again—'death to the traitor!'

'That is your verdict, then?' the President asked, a great shout of 'Ay' going up in reply.—'It is proper for you to see his refusal; we must be stern in spite of our justice. See for yourselves.' Saying these words, he passed the papers down the table from hand to hand, Maxwell reading them in his turn, though the whole thing was a puzzle to him. He could only see that the assembly were in deadly earnest concerning something he did not understand. He was destined to have a rude awakening ere long. The papers were passed on until they reached the President's hands again. With great care he burnt them at one of the candles, crushing the charred ashes with his fingers.

'You are all agreed,' he asked. 'What is your verdict to be?' And like a solemn echo came the one word, 'Death!' Salvarini alone was silent, and as Le Gautier took up the cards before him, his deathly pallor seemed to increase.

'It is well—it is just,' Le Gautier said sternly, as he poured the cards like water from one hand to the other. 'My friends, we will draw lots. In virtue of my office as President, I am exempt; but I will not stand out in the hour of danger; I will take my chance with you.'

A murmur of applause followed this sentiment, and the cards were passed round by each, after being carefully examined and duly shuffled. Maxwell shuffled the cards in his hands, quite unconscious of what they might mean to him, and passed them to Salvarini.

'No,' he said despondingly; 'there is fate in such things as these. If the lot falls to me, I bow my head. There is a higher Hand than man's guiding such destinies as ours; I will not touch them.' Saying these words with an air of extremely deep melancholy, he pushed the cards in Le Gautier's direction. The latter turned back his cuffs, laid the cards on the palm of one hand, and looked at the assembly.

'I will deal them round, and the first particular card that falls to a certain individual shall decide,' he said. 'Choose a card.'

The dagger strikes to the heart, came a foreign voice from the end of the table; 'what better can we have than the ace of hearts?' He stopped, and a murmur of assent ran round the room.

It was a thrilling moment. Every face was bent forward eagerly as the President stood up to deal the cards. He placed one before himself, a harmless one, and then, with unerring dexterity, threw one before every man there. Each face was a study of rapt attention, for any one might mean a life, and low hoarse murmurs ran round as one card after another was turned up and proved to be harmless. One round was finished, containing, curiously enough, six hearts, and yet the fatal ace had not appeared. Each anxious face would light up for a moment as the owner's card was turned up, and then be fixed with sickening anxiety on his neighbour's. At the end of the second round the ace was still absent. The excitement now was almost painful; not a word was spoken, and only the deep breathing gave evidence of the inward emotion. Slowly, one by one, the cards dwindled away in the dealer's hands till only seven were left. It was a sight never to be forgotten even with one chance for each; and when the first of the seven was dealt, a simple two, every envying eye was bent upon the fortunate one as he laughed unsteadily, wiped his face, and hastily filled and swallowed a glass of water. Six, five, four; the last to the President, and there only remained three cards now—one for Salvarini, one for Maxwell, and one for the suggester of the emblem card. The Frenchman's card was placed upon the table; he turned it up with a shrug which was not altogether affected, and then came Salvarini's turn. The whole room had gathered round the twain, Maxwell calm and collected, Salvarini white and almost fainting. He had to steady one hand with the other, like a man afflicted with paralysis, as he turned over his card. For a moment he leaned back in his chair, the revulsion of feeling almost overpowering him. His card was the seven of clubs.

With a long sweeping throw, the President tossed the last card in Maxwell's direction. No need to look at it. There it lay—the fatal ace of hearts!

They were amazed at the luckless man's utter coolness, as he sat there playing with the card, little understanding as yet his danger; and then, one by one shaking his hand solemnly, they passed out. Maxwell was inclined to make light of this dramatic display, ascribing it to a forger's love of the mysterious. He did not understand it to mean a last farewell between Brothers. They had all gone by that time with the exception of Le Gautier and Salvarini the latter looking at the doomed man sadly, the Frenchman with an evil glitter and a look of subdued triumph in his eyes.

'Highly dramatic, at anyrate,' Maxwell observed, turning to Le Gautier, 'and vastly entertaining. They seemed to be extremely sorry for me.'

'Well, you take the matter coolly enough,' the Frenchman smiled. 'Any one would think you were used to this sort of thing.'

'I should like to have caught some of those

expressions,' Maxwell replied. 'They would make a man's fortune if he could get them on canvas. What do you think of an Academy picture entitled "The Conspirators?"—And now, will you be good enough to explain this little farce to me?'

His cool, contemptuous tones knocked Le Gautier off his balance for a moment, but he quickly recovered his habitual cynicism. 'There will be a pendant to that picture, called "The Vengeance," or, if you like it better, "The Assassination,"' he replied with a sneer. 'Surely you do not think I dealt these cards for amusement? No, my friend; a life was at stake there, perhaps two.'

'A life at stake? Do you mean that I am to play the part of murderer to a man unknown to me—an innocent man?'

'Murder is not a pleasant word,' Le Gautier replied coldly. 'We prefer the expression "remove," as being more elegant and not so calculated to shock the nerves of novices—like yourself. Your perspicacity does you credit, sir. Your arm is the one chosen to strike Visci down.'

'Gracious powers!' Maxwell exclaimed, falling back into his chair faint and dizzy. 'I stain my hand with an unoffending man's blood? Never! I would die first. I never dreamt—I never thought—Salvarini, I did not think you would lead me into this!'

'I warned you,' the Italian said mournfully. 'As far as I dared, I told you what the consequences would be.'

'If you had told me you were a gang of callous, bloodthirsty murderers, I should not have joined you. I, like every Englishman, am the friend of liberty as much as you, but no cowardly dagger-thrust for me. Do your worst, and come what may, I defy you!'

'A truce to these histrionics,' Le Gautier exclaimed fiercely; 'or we shall hold a Council, and serve you the same. There are your orders. I am your superior. Take them, and obey. Refuse, and'—He stopped, folding his arms, and looked Maxwell full in the face for a moment; then turning abruptly upon his heel, quitted the room without another word.

Maxwell and his friend confronted each other. 'And who is this Visci I am to murder?' the artist demanded bitterly.

Salvarini bowed his head lower and lower till his face almost rested upon his breast. 'You know him,' he said. 'He was a good friend of mine once, and his crime is the one you are contemplating now—disobedience to orders. Is it possible you have not guessed the doomed man to be Carlo Visci?'

'Carlo Visci—my friend, my more than brother? I must be mad, mad or dreaming. Lay foul hands upon the best friend man ever had—the noble-hearted fellow whose purse was mine, who taught me all I know, who saved my life; and I to stab him in the dark because, perchance, he refuses to serve a companion the same! Never! May my right hand rot off, before I injure a hair of Carlo Visci's head!'

'Then you will die yourself,' Salvarini put in sadly.

'Then I shall die—death comes only once,' Maxwell exclaimed proudly, throwing back his head. 'No sin like that shall stain my soul!'

For a moment the two men were silent.

Salvarini broke the silence. 'Listen, Maxwell,' he said. 'I am in a measure to blame for this, and I will do what I can to serve you. You must go to Rome, as if you intended to fulfil your task, and wait there till you hear from me. I am running great risks in helping you so, and you must rely on me. One thing is in your favour: time is no particular object. Will you go so far, for your sake and mine?'

'Anything, anywhere!' burst out the Englishman passionately.

(To be continued.)

PITMEN, PAST AND PRESENT.

THE coal-trade of Scotland dates from the early part of the thirteenth century. In its earliest stages it embraced only the shallowest seams, and those without water, or any other difficulty requiring machinery to overcome. The digging of coal, therefore, is one of our oldest industries; and it may be interesting to look at some phases of the work from the miner's point of view. Taking this stand-point, we will see that the improvement in the miner's condition—physical, intellectual, moral and spiritual—is almost inconceivable. When machinery became necessary for pumping water from coal-pits—about the beginning of the seventeenth century—there appears to have been a demand for workmen greater than the supply, and power was granted to colliery owners 'to apprehend all vagabonds and sturdy beggars' and set them to work. This shows that the life of a miner was not at all an attractive one; and this is not to be wondered at, as will be seen from some of the allusions made in this article as we proceed. The one fact, that colliers were, for two centuries after the date referred to—that is, till near the end of the eighteenth century—bought and sold with the collieries in which they wrought, is sufficient to stamp mining as a most undesirable kind of employment, even in those early and more or less barbarous times. One can easily understand, from this instance of hardship, how it became necessary to keep up the supply of miners from the criminal classes. An analogous case still presents itself in Russia, where one of the most hopeless sentences that can be passed on political and other offenders is banishment to the Siberian mines.

Some time after the repeal (about 1790) of the laws enslaving miners, there would appear to have been experienced a similar difficulty to recruit the ranks of pit-workers, and one of the means adopted to procure workmen was only a few degrees less objectionable than slavery itself. This was what was termed the 'Bond' system. A man, more especially when he had a family, some of them coming to be helpful at his calling, had the bait held out to him of a bounty if he signed the bond. By this bond he obliged himself to continue in the employment of his master for a fixed period, varying from one year to four years. In return for this, he received the immediate payment of a bounty, variable in amount in proportion to the period engaged for, and also regulated by the value of the man's services. As much as five pounds

might be given. Should the bond be faithfully carried out by the workman, the master had no claim upon the money; but should the engagement be brought prematurely to an end, he often retained the power to claim the amount as a debt, besides having the right to sue the workman for desertion of service. Of course, the bounty formed a payment over and above the ordinary wages.

At the period referred to, it was the practice amongst many classes of workmen in Scotland to leave their usual avocations during the summer months, and fee themselves to farmers in the times known familiarly as 'lay and hairst.' From this custom, it was often a serious matter for a coalmaster to find that his workmen had deserted him. The 'bond' system was intended partly to counteract this practice, as well as to meet the prevailing unpopularity of the work. The system was a thoroughly bad one for the workmen, as it practically lengthened the period of actual slavery, though nominally that had disappeared. The inducement to sign the bond was very much the same as it now is to join the militia—the bounty-money gave the prospect of a 'speer' in both cases, and in this way the system operated badly.

We may well be astonished at the statement, that in the memory of men still living it was the regular thing for miners in some districts to go to and from the pits with bare feet. The wages were small and the hours long. We have heard it said by a miner that the grandfather of a companion a little older than himself wrought in the mines for twopence a day, he at the time being man grown. This case would take us back to about the close of the last century, when miners were employed compulsorily under an Act of Parliament. In any case it is an extreme instance of the small wages earned for a long time by miners. In regard to the hours of employment, even till a period well advanced in the present century, the usual time to begin work was four A.M.; whilst the hour for allowing the men to quit the mine was six o'clock at night—a length of day's work that left little time even for sleep. No wonder that such a joke should be in circulation that miners' children in those days did not know their fathers, as the children were asleep all the time the father was at home.

Not only had miners in times past hard work with long hours and small wages, but even the scanty earnings were settled up only at long intervals, and on this fact hangs a series of abuses that required a long and determined struggle to remove. Monthly pays were considered frequent; and it could hardly be expected that mining human nature could endure for a month even at a time without some temporary means being provided. Out of this arose some of the most indefensible hardships suffered by the miner. 'Truck' and 'Poundage' in all their various forms were the foul growths from the system of long delayed pays. The truck system had many developments. Let us begin with one of its earliest—namely, 'lines.' A workman wants an advance, and goes to the pay office for that purpose; but instead of getting hard cash, he receives a line to the following effect: 'Please give bearer goods to the value of _____.' This line

provision and dry-goods store, who had entered into an arrangement to honour these lines; and when they were brought to the colliery proprietor at stated intervals, the shopkeeper received payment of their amount, less an agreed upon commission, varying from five to ten per cent. But, supposing the storekeeper did not keep some of the goods required by the workman for his family or personal use, the workman could obtain a part of the sum marked on the line in money, less a discount of usually one penny per shilling. As time went on, however, another development of the truck system took place, and on the whole it was a little better than that described. The mine-owner provided a store, managed under his own charge, in which was sold everything from the proverbial 'needle to an anchor.' One of the sore points in the management of many of these works-stores was that the men were terrorised into buying all their goods there, and there alone. Indeed, where advances were given under the line-system, the poor miner had usually to spend nearly all his money in the master's stores. Even in the comparatively rare instances where workmen waited until the end of the pay without accepting advances, some of the colliery proprietors used a sort of tyrannical power over the men to force them to buy from the works-store, and that alone. Under the line-system, barter pure and simple obtained full play. And yet since the passing in 1831 of what is popularly known as the Truck Act, this barbarous method of payment was fully provided against, though the criminality of unscrupulous masters was not brought home to them until the Truck Commission sat in 1870. This Commission fully investigated the wholesale evasion of the law of 1831, and brought such a flood of light on the disgraceful proceedings of many masters, as to at once bring to an end the hateful truck or tally system. It forms a curious comment on the manner of administering our laws, that the Truck Act of 1831 only became operative in 1870, after a most exhaustive inquiry.

Whilst 'truck' was an attempt on the part of some masters to pay wages in kind and not in sterling money, what is known as 'poundage' was a different system of making a large profit off the poverty of the workmen—a system, unfortunately, which is not altogether dead yet. Under the system of poundage, the monthly or larger pays were continued—short pays would have been its death—but the privilege was granted to employees of receiving advances in cash during the currency of the pay. But this was done, let it be noted, for a 'consideration,' that consideration being the grand and simple system of five per cent.—a shilling a pound. This is how the calculation would work out: In a four-weekly pay, let us presume that there are only three advances made—if there were more it would not alter the principle at work—one made each week for three weeks, and each advance amounting to one pound. The first advance is twenty shillings for three weeks, the second for two weeks, and the third for one week—the whole advances during the currency of the pay amounting to three pounds, and costing the workman three shillings. This looks a very simple charge—five per cent.; but when we look at it in the light of being interest on

lent money, we find the first pound has cost 83½ per cent. per annum; the second, 130, and the third, 260 per cent. per annum—or an average of nearly 160 per cent. per annum on the whole. It must be remembered too that this was the rate of interest charged, not for an unsecured debt, but rather for wages actually earned by the employee, though settlement was deferred for a month through the system of long paya. The writer has known a firm derive from this one source of income as much as a thousand pounds a year up to the time a more enlightened policy was adopted.

Another system from which unscrupulous employers derived some income, more trifling in amount than the annoyance and irritation it produced, was that known as 'Fines.' In remote collieries, fines were of regular occurrence under one pretext or another. It is quite likely that the system was a survival of feudal jurisdiction exercised by the superior all over the country, and finally put an end to, as it was supposed, by Act of Parliament passed in 1747. Instead of the workman being brought before a magistrate for an alleged offence, a court-martial was held upon him by the employer or manager, and a fine was usually exacted. It mattered not whether the offence related to the man's employment or to his conduct with his neighbours, whether it had a criminal or only a civil origin—the court-martial was held, and the result invariably the same—a fine. The curious thing was that these fines were taken as a matter of course, the decisions being usually respected after a little necessary grumbling. That amount of money gained annually from these fines was not large, so that their justification must have been that this was the only available method of keeping law and order. In this view, 'fines' may have suited an earlier state of civilisation; but the system is too rough and ready to be consonant with modern ideas of justice. The miner has suffered under slavery, and its twin-brother the bond system; but he has seen these totally disappear, not, however, very many years before slavery was abolished amongst the aborigines of our colonies. Truck or the tally system has also become a thing of the past, though we have seen how hard it was to kill. Fines likewise have given place to the ordinary operation of the law; and the exaction of poundage is now only made by a small residuum of coal-masters, on whom the action of public opinion is slow and uncertain; but the system is doomed, and must, sooner or later, follow the other abuses we have enumerated.

We will now look for a short time at a different phase of the subject, 'Pitmen, Past and Present;' and in this no less than in the past, already treated, it will be found that there is a strong contrast between the past and the present in the miner's condition. Take as an example the ventilation of mines. The benefits brought about in the miner's health by the greater quantities of fresh air now forced into the pits are almost incalculable. A 'whoeeing' miner of thirty is now a very rare phenomenon; indeed, apart from the inevitable danger from accidents—and that is even greatly lessened—the miner has now nearly as good a chance of long life as any other class of workmen. At a period within the

memory of not very old colliers still living, the pit was merely a hole in the ground, having no separate upcast and downcast division, so essential to proper ventilation. In short, there was absolutely no attempt at the artificial ventilation of the mines. The only agent at work was the wind on the surface, and this was as often as not adverse to the pitman. In the heat of summer, the mine became quite unworkable from the rarefied and polluted nature of the air. From the operation of various causes, this state of things has been altered to the great benefit of the miner. An air-tight mid-wall is now made in each pit: the one side of the shaft being used for drawing out—by fans or otherwise—the foul air; and the other for the introduction into the mine of a current of fresh air, which finds its way through all the workings until it reaches the upcast shaft, and there obtains an outlet. In addition to this, every shaft has now a communication pit, either expressly made for that purpose, or advantage may be taken of some old pit for giving pitmen a certain means of exit and entrance in the event of a shaft being blocked up through accident.

The year of the famous battle of Waterloo is one that should ever be remembered gratefully by miners. It was then that Humphry Davy perfected his safety-lamp, that has done so much for mankind. How much it has done to prevent accidents no one can say. Being a preventive, all we can claim is that it must have rendered the annals of mining comparatively free of the records of accidents, and given a degree of comfort and safety in the fiercest mines that otherwise would be impossible, besides making available for public use a vast amount of coal that without it would be unworkable.

In regard to the age of those engaged in mines, thirty, forty, or fifty years ago it was the rule rather than the exception to send boys to work at eight or nine years of age. The Mines Act of 1872 wholly prohibits the employment below ground of women or girls of any age, and fixes for boys the minimum age at twelve for a full day's employment, and that only when a certain educational standard has been reached. Curiously enough, however, a boy above ground cannot be engaged full time until he is thirteen years old. Surely it is one of the unintentional anomalies of the Mines Act that in the open air boys are precluded from working till they are a year older than they may be at work underground. A warning note may be sounded in regard to the age at which boys are engaged. We know that many are employed in mines at the minimum age of twelve, irrespective of their educational standard. If the Education Act and the Mines Act are here at variance, or if there is the want of a public prosecutor to see them enforced, the wants should be without waste of time supplied, and not cause beneficial clauses to be inoperative.

Respecting the education of miners' children, the Education Acts have been highly advantageous in giving compulsory powers to School Boards and managers; but even before their introduction, this class of children had many comparative benefits in a much less degree enjoyed by others. The works-schools have always been a feature in Scotch mining centres. We have not seen any pointed allusion to the fact that these schools, long before the introduction of Education

Acts, solved the problem of free education in a way satisfactory to all concerned. Happily, in many places these schools are still left under the old management, though nominally connected with School Boards. Under the works-school system, all the workers, whether married or single, agreed to pay a weekly sum, say, of twopence. This insured the education of the workman's family, however large it might be. The unmarried suffered by this voluntary sacrifice on their part, but they did so at a time of life when they were least burdened; but the struggling married man reaped the full benefit when he most needed assistance. In the case of a workman with four children of school-age at one time, the almost nominal cost of a halfpenny per week paid for each child's education. Small though this sum is, we have known schools self-supporting under the system for years, with no other aid than the government grant earned at the annual inspection, besides being able to supply night-school education in the winter months to the elderly youths of the place.

Besides a school, it is one of the evidences of the improved state of mining communities that they usually have all the adjuncts of civilisation amongst them. There is the church, where the rich and the poor meet together, and in this connection it may be said that miners are as a class either very zealous religionists, or they go to the other extreme, and care for none of these things. The clergy of our day is largely recruited from mining villages; whilst the list of miners who have become home missionaries is a long one. Then there is the Temperance Society, either a Good Templars' Lodge, or an offshoot from some of the other anti-alcohol societies; there is the Library of well-selected books, which are much read. There is the Savings-bank; the Reading-room, with a full supply of daily newspapers and other periodical literature; the String and Read Bands; the Bowling Green, Football and Quoting Field—the amusements of the miners of our day being all on a higher level than those of forty years ago, when cock-fighting and dog-fighting monopolised attention. Nor can we omit to mention that Sick and Funeral and other benevolent Societies are marked associations in every colliery village worthy of the name. Miners are indeed remarkably considerate to each other, when any special emergency occurs to call forth their active sympathy, being ever ready to subscribe for a brother-worker who has been unfortunate beyond the common lot.

The prospect of the temporary nature of a mining village at the best, forms a strong temptation for nothing but necessary house accommodation, and that of the barest kind, being provided for workmen. The mining proprietor takes a lease of a mineral field, in the middle of a moor it may be, where no houses exist, and where everything has to be erected and provided. Accommodation for the workpeople has to be erected whether the field proves successful or not; and when the field is exhausted, he is in the power of the landlord whether he must remove the buildings and restore the ground, or leave them as they are. In either of these cases, the mineral lessee receives no compensation for his outlay, usually of many thousands of pounds.

Hence, as we have stated, there is much temptation for the colliery lessee to erect flimsy houses in keeping with the possible shortness of their use. But colliery owners often rise superior to this evident temptation, and in spite of the possible unremunerative nature of the mineral field, excellent houses, with copious water-supply, are provided. Where this is done, naturally a better class of workers settle down; and when there is a fairly good prospect before the lessee, it is doubtless nothing but justice to himself and his workmen to afford the men every comfort.

It is not too much to say that in the best collieries, the interests of the workmen are cared for in the most enlightened manner. Situated as are many colliery villages, beyond the oversight of regularly constituted municipalities, the whole onus of sanitary and other regulations falls upon the master, and he does not shirk his duty in such cases. Means of social enjoyment are provided—the physical, intellectual, moral, and spiritual well-being of the populace are cared for, and the colliers of to-day are in consequence an intelligent and respectable class of men. Crime is proportionately small amongst mining villages, and those who best know the miner are aware that he is possessed of much kindness of heart, and that in the prosecution of his dangerous calling he often exhibits true heroism.

GEORGE HANNAY'S LOVE AFFAIR.

CHAPTER V.—THE EDITOR'S SANCTUM—
A DISCLOSURE.

ALFRED ROBERTSON felt the smart of Nan's summary dismissal more than he could have expected, or even than he owed to himself. His vanity was sorely hurt, and he lost a good deal of that audacious *insouciance* in his manner towards the opposite sex for which he had been before remarkable. He sent back Nan's letters honourably enough, and set himself to forget her, as she had him. In order to effect this, he determined to supplant the old love by a new; and commenced paying marked attentions to Miss Curtiss, the twenty-thousand-pound young lady. His suit prospered, and the fair one capitulated; but the terms of the surrender were to be fixed by her friends. They made objections to the smallness and uncertainty of his income. On the other hand, Alfred's solicitor found the young lady's properties were so heavily mortgaged as only to leave a very small margin of income; and the result was the negotiations were broken off. Then, somehow or another, his society was no longer so eagerly sought after. A young violinist had taken the place he formerly held in Mrs Judson's social circle, and when that gentleman was present, Alfred was cast entirely in the shade. But there was worse than that: he could no longer find a market for the remainder of his manuscripts. The publishers and editors who had patronised him before were desirous of seeing what course the *Olympic* took with regard to him. It was

very singular, they thought, that there never was any second article from his pen inserted in it. Some ill-speaking folks even went the length of hinting that he wasn't 'Ariel' at all; that the claim he made to that *nom de plume* was a mere ruse to get into society, and get some of his trashy manuscripts palmed off on unsuspecting editors and publishers.

He felt these things very grievous to hear: the only hope that buoyed him up was, that when the editor of the *Olympic* returned to town, all would be put right. He would go straight to him and say: 'I am Ariel! and here is a much superior sketch to the one I first sent you. Insert it, and I will not haggle with you about the amount of the honorarium, for I know you are a generous paymaster.' Then all would again be well; he would resume his proper place in society, and his writings would be as eagerly sought after as ever.

It was towards the end of March when Mr Hannay returned from his prolonged continental tour. Allowing him a day or two to get settled down, one blowy, blustering forenoon, Alfred sallied forth to call on him. He sent in his card, and in a few minutes was in the editor's sanctum.

'Pray, be seated, sir,' said Mr Hannay politely. 'I—I do not remember your name, Mr Robertson.'

'Ah, I daresay not,' he replied, smiling. 'You'll know me better by my *nom de plume*. I am Ariel!'

Alfred was gratified to see the slight start which followed this important announcement, and he likewise became conscious that he was being inventoried by a pair of keen black eyes. He put a favourable interpretation on these indications of interest.

'And what then, Mr Ariel, can I have the pleasure of doing for you?' said Mr Hannay after a brief pause.

'Well, sir, I have an excellent little paper here,' Alfred replied, producing a manuscript from his coat-pocket. 'It is entitled "A Week's Yachting on the Rhine." It is very carefully written; and I can vouch for its accuracy in details, as it is extended from notes I made when yachting there with a friend.'

'Oh, very well, sir,' said the editor, laying the paper aside. 'I'll take a look at it. But I can hold out hardly the least hope of being able to accept it. We are literally deluged with that sort of matter, and can't find room for one in fifty of the manuscripts that are sent us.—At anyrate,' he added, laughing, 'it would require to be a little better than your "Ramble in Kirkcudbright."'

What could all this mean? thought the bewildered Alfred. Was the editor making a fool of him? At the very suggestion, he flushed red, and it was with an effort he was able to stammer forth: 'And pray, sir, if the article was so worthless, why did you accept it? And why did you send me so handsome an honorarium?'

The editor looked both surprised and puzzled. Instead of replying to the question, he asked one: 'Are you the gentleman who is engaged to be married to Miss Anne Porteous?'

'No!—Yes! That is to say, I was engaged, but am not so now.'

'Indeed! And how is that?' said the editor, with an air of interest.

'Well, you see,' said Alfred, who had now regained his self-possession, 'my friends advised me to break off the connection. You know, between ourselves, it wouldn't do for a literary man of any standing to marry a common inn-keeper's daughter; although I must say the girl herself was well enough, and might have passed muster after a little training.'

The editor's eyes became blacker, keener, and sharper—they seemed almost to flash fire as he said: 'You would know what she was, I suppose, when you sought her love.—Yes? Then what right had you to avail yourself of that as an excuse for casting her off? It's about the most unmanly thing I ever!'

'Hold, hold!' cried Alfred, who saw he had gone on the wrong tack for conciliating the editor's favour. 'You misunderstand the matter. My friends wanted me to break off the marriage; but I never proposed such a thing to the young lady. I meant to marry her in two or three years honourably. But she wrote to me; and I went down to see her—and we had a quarrel, and she broke off the engagement herself—upon my honour, she did!'

The editor's features relaxed their tension; there was almost the suggestion of a smile lurking in the corners of his mouth. 'Well, Mr Robertson, I am glad you have cleared your character so well.—You are anxious to know why I accepted your first paper. This, I think, will explain it,' he added, unlocking a private drawer and handing him a manuscript.

Alfred looked at it with a stupefied air. Here were a dozen sheets of foolscap covered with Nan's neat lady-like writing, and signed Ariel; reply to be addressed, Ariel, Glenduce post-office.—To be till called for.

He felt as if he were listening to a voice in a dream, as the editor went on to say: 'You see, sir, I heard that Nan was going to be married to a young student she had met in Brussels. Now, students, as a rule, are not over-burdened with ready cash; and when I got the manuscript in her handwriting, I readily came to the conclusion that it was a production of her lover's, and that she had copied it out in her own handwriting, thinking that, for old acquaintance' sake, I would stretch a point, and give it admission to our pages, and pay handsomely for it. This I did; for I thought that, as her father would be certain to be opposed to the match, a little ready cash would be useful to her and her lover in taking up house. In fact, I may say I sent the little sum as a marriage present! But I cannot understand how you are not aware of all this.'

The whole truth was now made plain to the unfortunate lover. He remembered now her snatching the letter from his hand and running up-stairs with it. He remembered now her red and sleepy-looking eyes the next morning. He knew now the cause—the devoted girl had sat up all night copying his manuscript, so that it might have the better chance of acceptance! How carefully she had kept the knowledge to herself of the great service she had done him,

and that in spite of his foolish gasconading talk! To her and her alone he owed his little brief season of popularity and success: and that popularity and success was the cause of his looking down on her! Oh, what a blinded fool he had been—blinded by his own selfish vanity!

He mumbled a few words of explanation to the editor, and left the office a sadder and, it is to be hoped, a wiser man. He thought of flying to Nan, throwing himself at her feet, and entreating her forgiveness and love. But remembering the proud white face, the outstretched arm pointing to the door, and the clear emphatic 'Go!' twice repeated, he shook his head sadly, and muttered, 'Too late—too late.' It may be said here that he gave up literature for good and all, obtained a situation as a surgeon in an emigrant ship, fell in love with a lady-patient during the voyage, married her on their arrival at Sydney, and starting the practice of his profession, settled down there.

As for the editor of the *Olympic*, he went down as usual the following September to Locheneck, repeated a question he had asked before, and got a different reply. Nan is now his wife.

THE MONTH:

SCIENCE AND ARTS.

THE late meeting of the British Association at Birmingham has proved a success with regard both to the attendance of members and to the importance of the various papers read in the several sections. Next year the Association will meet at Manchester, and the year after at Bath. The suggestion from Sydney, that the Association should in 1888 visit New South Wales and hold its meeting there in the January of that year, cannot, on account of many difficulties which are foreseen, be accepted in its entirety. But it is intended that about fifty members shall form a representative delegation to our Australian colony, their expenses being liberally defrayed by the government of New South Wales. It is very pleasing to record this little sign of the good-fellowship which exists between far-off Australia and the mother-country.

We expressed a hope some months ago that an institution of a permanent nature might grow out of the splendid Indian and Colonial Exhibition at South Kensington, which in a few days will close its prosperous career. It has now been proposed by the Prince of Wales that the Jubilee of Queen Victoria's reign shall be commemorated by an Institute which should represent the Arts, Manufactures, and Commerce of Her Majesty's Colonial and Indian Empire, and which should be at once a Museum, an Exhibition, and the proper locality for the discussion of Colonial and Indian subjects.

Very little is heard now of tempered or toughened glass for domestic purposes, although, a year or two back, such glass was much advertised and its praises constantly sung. We understand that the reason why it has at present disappeared from public notice is that its efficiency does not last. When fresh from the factory, it can be dropped from a height on to the floor and knocked about with impunity. But some gradual and not understood change occurs in its

constitution, for after a short time it will fly to pieces without any apparent cause. It is said, too, that unscrupulous traders who have a stock of the faulty material are selling it as ordinary glass. Those, therefore, who experience unaccountable breakages, will know to what cause to attribute them. A really unbreakable glass would be such a boon, that it is to be hoped that further experiment will soon show how it can be manufactured.

From some recent experiments in New York, it would seem that the danger of using dynamite as a charge for explosive projectiles has been obviated. The weapon used was a four and a half inch rifled gun, with a charge of three and a quarter pounds of gunpowder, the experimental shells holding each more than one pound of dynamite. To avoid any risk from concussion, and premature explosion of the shell in the bore of the gun, the cartridge and shell were separated by wads made of asbestos. Twenty-seven shells were fired with such safety to the gunners, that the extraordinary precautions observed during the first rounds were ignored during the later ones.

The boat, which the other day twice crossed the Channel between Dover and Calais affords an example of the rapid progress which has lately been made in the science of electricity. This little craft, which is only thirty-seven feet in length, glided over the water with no visible means of propulsion. The voyage was an experimental one, and was designed to show that this plan of electrical propulsion was as practicable on the sea as before it had been proved to be on inland waters. Such a boat could, say her promoters, be carried hanging to the davits of a ship, and be ready for immediate use. The required electrical current is derived from accumulators, or secondary batteries, stored and acting as ballast beneath the deck floor of the little vessel. These require to be charged by a dynamo machine at intervals, and such a charge this Channel trip amply proves will suffice for a run of between forty and fifty miles. Supposing that the system were adopted for torpedo vessels, it is obvious that this amount of storage capacity would be far more than sufficient for ordinary needs.

Another vessel which obtains its motive-power from a very different source, but which must also be looked upon as an experimental boat, has been invented and built by Messrs Secor of Brooklyn. Unlike the electric boat, it possesses no screw propeller or other moving parts. But it is furnished on each side with open ports below the water-level, which are in communication with an 'exploding chamber.' This chamber is constructed of steel, and is capable of sustaining an enormous internal pressure. It is filled with charges of petroleum vapour and air under pressure, and this explosive mixture is ignited by electricity. It will therefore be seen that the propelling apparatus of this boat may be compared to a gas-engine; but the explosions, which occur several times in a minute, instead of forcing forward a piston to act upon a fly-wheel, impinge upon the water at the stern of the vessel, and so push the boat forward. Should this method of driving a vessel through the water prove efficient, it will certainly be economical, for little more than half a barrel of petroleum will suffice for a twenty-four hours' run.

Another invention from Brooklyn is of far greater importance than the one just recorded, for it is of a life-saving character, and is designed to prevent those collisions at sea which seem to be so greatly on the increase. It consists of a marine brake, and is the contrivance of Mr John M'Adams. The experimental vessel, *The Florence*, which is fitted with the brake, has been reported upon officially, and the behaviour of the apparatus is highly commended. The brake consists of two wings made of steel, one on each side of the vessel and below water-level. These have the appearance of flat boards about eight feet square, hinged to the stern-post, and which when not in action fold forwards, secured by hidden chains, close to and touching the vessel's sides. In case of danger of collision, the touch of a button by the captain on the bridge will loosen these chains, and cause some springs to act upon the wings, so that they fly out at right angles to the sides of the ship. In this position they are held by the now lengthened chains, and form an obstacle to the water, which checks the motion of the vessel immediately, even if the engines continue to work. If the engines are stopped at the moment the brake is put into action, the ship is brought to a standstill in twenty-two seconds. If, again, the engine be stopped and reversed at the moment of working the brake, the vessel commences to go astern in the remarkably short space of twelve seconds. It will be seen from these results that the invention gives every promise of being of great use. Besides being efficient, it is simple in character, and, from its nature, cannot be a very expensive additional fitting to a ship.

The lamentable accident at the Curragh Quarries, by which seven persons lost their lives, is happily a most unusual one, although in character it is closely allied with those fatalities from 'choke-damp' by which so many poor colliers have been killed. The explosion of gas underground, or of gunpowder above ground, leads to the evolution of a quantity of carbonic acid gas, or, to call it by its proper name, carbon dioxide, the principal product of combustion in either case. In the workings of a mine, this gas fills every available space, and has no outlet. In the quarry, on the occasion referred to, much the same condition of affairs existed, for there was no wind to carry off the deadly vapour, and its natural heaviness made it cling to the place of its creation. The surviving relatives of the victims of this accident have our heartfelt sympathy. They will be comforted by knowing that death under such conditions is supposed to be painless. It is a sleeping to sleep, but a sleep, unfortunately, from which there is no awakening in this world.

The little town of East Moulsey is now lighted, so far as its public lamps are concerned, by paraffin instead of gas, as heretofore. The reason of this apparent retrogression is found in the excessive demands of the Gas Company, who required the local board to pay at the rate of four guineas per annum for each lamp. This the local board refused to do, and provided the district under their care with paraffin lamps. They are rewarded for their pluck by finding that the cost of the oil-lamps is but one half of the charge demanded by the Gas Company, and by hearing the generally expressed opinion of

the people that the place had never before been so well lighted.

The recent earthquakes, which have caused such fearful havoc and loss of life both in Southern Europe and in America, remind us that our knowledge of the causes of such terrible phenomena is very meagre, and that science has not yet discovered any means by which their occurrence may be predicted. But, in spite of these admitted facts, there are not wanting on occasions of earthquake self-styled prophets, who will holdily declare what the morrow will bring forth. Such mischievous charlatans do much harm, for they terrify the ignorant at a time when men's nerves have been already unstrung by recent calamities. In the year 1750, when London felt a sharp earthquake shock, a prophet announced the immediate coming of the judgment day. Another predicted a terrible earthquake for a certain night, with the result that the people encamped in thousands in Hyde Park. Coming nearer to present times, we may note the destructive earthquake in 1881 in the island of Ischia. Here, again, there was a prophecy that there would not be another visitation of the kind for eighty years. But only two years after this the beautiful island was shaken to its foundations, and many lives were lost. During the late disaster at Charleston, a prediction was made that upon the 29th of September a fearful catastrophe was to take place. The originator of this mischievous statement should be severely punished.

We have lately received from Messrs Burton Brothers of Dunedin, New Zealand, a set of most interesting photographs, taken in the neighbourhood of Tarawera and Rotomahana, immediately after the late volcanic eruption. Were we not aware of the terrible facts, we should suppose that these were winter scenes, for the trees are stripped of their foliage, and everything is covered with a white ash, which in the photographs looks like snow. The ruins of M'Raes' hotel at Wairoa, of which there are front and back views, exhibit such a mass of broken masonry and twisted iron-work, that one can hardly believe that the place has not been bombarded.

We are glad to learn, from the *New Zealand Herald*, that the layer of ashes which covers so many miles of the country, will not, as was at first feared, choke and kill every blade of grass, but will probably in time act as a valuable fertilising agent. Already the grass is in many places growing up through the dust; but the ash has been submitted to experiment, and is found to be really nourishing to plants grown in it. Mr Pond, a resident analytical chemist, obtained several samples of the volcanic dust, and sowed in it grass and clover seeds, and kept them moistened with distilled water. In each case, we are told, the seedling plants have come up well and are growing vigorously; it is therefore hoped that those districts which have received only a light covering of this dreaded dust will find that the visitation will in the end prove beneficial to their crops.

As we stated last month, the armour-plated ship *Resistance* has lately formed a target for various experiments with different types of guns. The unfortunate old ship is now being subjected

to attacks by torpedoes, the object being to determine the nearness at which one of those submarine mines can be exploded without injury to a vessel when protected by wire-netting. It is proved that if the defensive netting is supported on booms thirty feet from the ship, it forms a good protection from torpedoes, and that though a torpedo should explode on touching the netting, as it will do if fitted with the new form of pistol trigger, which is very sensitive, the explosion will do no great harm. The distance of the netting from the ship will be gradually reduced until the *Resistance* can resist no longer, and must be destroyed.

A strange sight was lately witnessed at Salzburg, in the shape of a vast procession of butterflies, which passed over the city in a southerly direction. They seemed to fly in groups, and while preserving one line of direction in flight, the groups revolved round that line. This aerial insect army must have numbered millions of individual butterflies. From those which fell to the ground, it was seen that they were of the kind known as willow-spinners.

Photographic tourists—and their name now is legion—will all admit that their greatest drawback is represented by the weight of the glass plates which they must carry from place to place in addition to their other apparatus. This difficulty has just been obviated by the introduction of a material as a support for the photographic image which is as light as paper, so that in the compass of an ordinary two-shilling railway novel, the tourist can carry with him the sensitised material for a couple of hundred pictures. This material is known as Woodbury tissue, and was the last invention of the late eminent experimenter who gave his name to the beautiful Woodburytype process of photography. His successors have brought the tissue to marketable perfection, and produce a material as translucent as glass and one-twentieth part of its weight. The tissue is used in a singularly ingenious form of duet slide or double back, which can be readily adjusted to existing forms of cameras.

In the *Camera* magazine, a very curious phenomenon in connection with photography is recorded by the person who observed it. He took a portrait of a child apparently in full health and with a clear skin. The negative picture showed the face to be thickly covered with an eruption. Three days afterwards, the child was covered with spots due to prickly heat. 'The camera had seen and photographed the eruption three days before it was visible to the eye.' Another case of a somewhat similar kind is also recorded where a child showed spots on his portrait which were invisible on his face a fortnight previous to an attack of smallpox. It is suggested that these cases might point to a new method of medical diagnosis.

The Severn tunnel, one of the greatest engineering undertakings of modern times, is at last finished, and will be shortly open for passenger traffic, as it has been some weeks for the conveyance of goods. The total cost of this great work is estimated at two millions sterling. The cost has been greatly augmented by the unlooked-for difficulties which have cropped up during the progress of the works. Commencing in 1873, the contractor had made steady progress for the

following six years, when a land spring was accidentally tapped, and the partially constructed tunnel was flooded. Again, in 1881 the sea-water found out a weak place on the Gloucestershire side of the works, and poured in in torrents. Once more, in 1883 the old land spring again filled the works with water, which had to be pumped out; and finally, about the same time, a tidal wave brought about a great amount of destruction to the works; so we may look upon the completed tunnel not only as a great monument of engineering skill, but as an example of unusual difficulties well grappled with, and finally overcome.

OCCASIONAL NOTES.

PHARAOH'S HOUSE.

It is but a month or two ago that people of an archaeological turn of mind were delighted with the tidings sent home by the Egypt Exploration Fund of the discovery of Pharaoh's House in Tahpanhes. An account of the wonderful old ruin and its relics of a past civilisation has been already given; but it may interest many to know that a number of antiquities have been collected and sent home, and have recently been on view at the Archaeological Institute at Oxford Mansion. It will be remembered that the ruins were as much those of a military fortress as of a royal residence, and the objects recovered are almost entirely those which would be likely to be found in either of two such places.

The first things of interest are the foundation deposits, from under the four corners of the castle, which consist of small vessels, little tablets engraved with the name and titles of the royal founder, Psammeticus I., specimens of ore, &c. The chief articles of jewelry are earrings, rings, amulets, and engraved stones bearing traces of Greek workmanship, having been probably manufactured by Greek jewellers in the town of Tahpanhes, or Daphne. Numbers of small weights have been turned up while digging among the ruins, which it is thought were for weighing the gold and precious stones previous to purchase.

Rome, too, has left her mark among the charred remains of this ancient stronghold, and some rings with names inscribed upon them, and tokens of good Roman work, prove an intercourse with that nation. There is a little silver shrine case in which is a beautiful statuette of the Egyptian war-god, Mentu. Possibly, it may have once been a talisman belonging to Pharaoh Hophra. A silver ram's head and gold handle complete the list of the most important specimens of jewelry.

Among the domestic treasures are a long knife, fourteen inches long and quite flat; this comes from Pharaoh's kitchen; so also do the small frying-pans, and some bowls, bottles, dishes, plates and cups, all of which date from B.C. 650, and were probably used daily by the royal household. An old brazier and some ring-stands have also been brought home. From the butler's pantry come amphore stoppers, stamped with the cartouches of Psammeticus I., Necho, Psammeticus II., and Ahmes. These were clay

stoppers, sealed by the inspector, and then plastered over and stamped with the royal oval. Ten specimens of these Mr Petrie has sent home. Arrow-heads, a sword-handle and part of the blade, a horse's bit of twisted pattern, some spikes from the top of a Sarlinian mercenary's helmet, knives and lances, and some fragments of scale-armour, show that the old castle had once been a military stronghold.

This is but an outline, showing the kind of specimens found among the ruins of El Kasr el Bint el Yahudi (the Castle of the Jew's Daughter), and serve to add to the innumerable proofs—if proof were needed—of the advanced civilisation of the ancient Egyptians. It is believed that those antiquities will eventually be divided between the Museum at Boulak (Cairo), the British Museum, the Museum of Fine Arts at Boston, U.S., and several of the provincial museums of Great Britain.

THE EMIGRANTS' INFORMATION OFFICE.

It is satisfactory to know that government has at last opened an office for the dissemination of authentic information to intending emigrants. The emigration schemes before the country are legion; but those who apply here will be safe to receive information as to the British colony to which they propose to emigrate, which does not spring from any interested motive. At the same time it is always safe for intending settlers to supplement any knowledge received in this way by authoritative handbooks, books of travel, and the experiences of former settlers. Now that there is a prospect of the Indian and Colonial Exhibition becoming a permanent institution in our midst, we will be kept pretty well informed as to the position and prospects of our different colonies. The premises of the Emigrants' Information Office are at 31 Broadway, Westminster, London, S.W. The office will be open every day from twelve noon to eight p.m., except on Wednesdays, when it will be open from ten a.m. to one p.m. The circulars issued by the office will be sent to the secretaries of any societies or institutions who will send in their addresses to the chief clerk.

INCREASED CONSUMPTION OF BRITISH-COLONIAL TEAS.

In a paper read by Mr L. J. Shand of the Ceylon Court at the Colonial and Indian Exhibition, the present position of the Indian tea-trade was reviewed. British-colonial teas, which in 1865 formed but three per cent. of the total quantity consumed in the United Kingdom, amounted to sixteen per cent. in 1875, and to thirty-three per cent. in 1885. India had two hundred and fifty thousand acres under tea-cultivation, and produced seventy million pounds of tea; the capital invested in the industry was sixteen million pounds; and a quarter of a million of Her Majesty's subjects, who indirectly contributed to the income tax of Great Britain, were engaged in it. The tea-plant was introduced to Ceylon from China about the year 1842; but it was not till coffee was stricken by disease that attention was generally directed to the cultivation of tea in Ceylon. In 1873, a small parcel of twenty-

three pounds of tea was exported from Ceylon; this year, nine million pounds would be exported, and, estimating the acreage now planted with tea, the exports in 1890 would be forty million pounds. Proceeding to consider why British people should drink British-colonial teas, Mr Shand said that these teas came into the London market pure; there was no recorded evidence of adulteration having been discovered. The adulteration of China tea, on the other hand, had been the subject of several volumes and of special legislation. The purity of Indian and Ceylon teas made them more sensitive than the ordinary China mixture. It was not necessary to put such large quantities into the teapot, but it was all the more necessary that the water should be boiling and that the tea should not be allowed to stand too long. Disappointment should not be felt because the liquor was not black; that was in consequence of the tea being quite pure and unmixured with blacklead or indigo. If Indian and Ceylon teas were fairly tried and carefully treated, they would be found more economical than China teas.

IF THIS WERE SO.

O Love, if I could see you standing here,
I, to whom the memory of a scene—
This lane, tree-shadowed, with the summer's light
Falling in golden showers, the laughs between,
Upon your upturned face—shines out as clear,
Against the background dark of many a year,
As yonder solitary starlet bright
Gleams on the storm-clad bosom of the night.

If this were so—if you should come to me
With your calm, angel face, framed in with gold,
And lay your hand in mine as long ago
You laid it coldly, would the love untold
Hidden within my heart, set my lips free
To speak of it and know the certainty
Of love crowned or rejected—yes or no?
O Love, I could not speak if this were so.

But if you came to meet me in the lane
With footsteps swifter than you used of yore—
And if your eyes grew brighter, dear, as though
They gladdened at my coming back once more—
If, when I held your little hand again,
Your caleness grew less still, then not in vain
My heart would strive to speak, for it would know
What words to utter, Love, if this were so!

KATE MELLERSH.

The Conductor of CHAMBERS'S JOURNAL begs to direct the attention of CONTRIBUTORS to the following notice:

- 1st. All communications should be addressed to the Editor, 339 High Street, Edinburgh.
- 2d. For its return in case of ineligibility, postage-stamps should accompany every manuscript.
- 3d. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them in FULL.
- 4th. Offerings of Verse should invariably be accompanied by a stamped and directed envelope.

If the above rules are complied with, the Editor will do his best to insure the safe return of ineligible papers.

NOTES ON THE NEW HEBRIDES.

THERE is a wide contrast between the Hebrides of Scotland and the New Hebrides of the Western Pacific; but both have come into a good deal of prominence of late—the one in connection with the crofters, the other in connection with the French. It is of the New Hebrides we propose to say something.

The group of islands forming part of Meianesia to which the name of New Hebrides has been given extends for about seven hundred miles. The most northern of the group is about one hundred miles from the Santa Cruz Islands, and the most southern about two hundred miles from New Caledonia. *Espirito Santo* is the largest and most northerly of the group, and is about seventy-five miles long by forty miles broad. The next largest island is called *Mallicolo*, and is fifty-six miles long by twenty miles broad. The entire land area of the group may be taken as about five thousand square miles; and the population of the whole group has been estimated variously from fifty thousand to two hundred thousand. But whatever the total population, the peoples probably sprung from one original stock, although they have drifted far apart in the matter of language. There are said to be no fewer than thirty different languages in the New Hebridean group—all having a certain grammatical likeness, but quite unintelligible to the other islanders. The difference is not merely such as exists between Scotch, Irish, and Welsh Gaelic; it is a more marked division of tongues.

The inhabitants vary nearly as much as their languages. Although distinctly Papuan, there are traits and traces of Polynesian intermixture and even of separate Polynesian settlement. Thus, on *Vatú*, the men are taller, fairer, and better-looking than those on some of the other islands, the more generally prevailing type being one of extreme ugliness and short stature. They all are, or have been, cannibals; but on *Aneityum* they are now supposed to be all Christianised.

Aneityum, or *Anateum*, or *Anatom*—for it is

spelt in all three ways—is within two hundred miles of the nearest point in New Caledonia, and, within five hundred miles of Fiji. It has a spacious, well-sheltered harbour, which is easy of access, and is throughout well wooded and watered. The general character of the island is mountainous; and there is an agreeable diversity of hill and valley, the mountains being intersected by deep ravines, and cultivated spots alternating with barren tracts. The principal wealth of this island is in its timber, of which the kauri pine appears to be the chief; but there is also a good deal of valuable sandal-wood. Some years ago, an attempt was made to establish a whale-fishery off the shores of *Aneityum*; but we have not heard with what result. The length of this island is about fourteen miles, and its breadth about eight. The climate, although damp, is not disagreeable, and is not marked by great variations. The thermometer seldom goes below sixty-two degrees, and never below fifty-eight degrees; but, on the other hand, it never goes above ninety-four degrees, and seldom above eighty-nine degrees in the shade.

Aneityum deserves especial mention because the whole population is understood now to profess Christianity. That population in 1865 was stated by Mr Brenchley to be two thousand two hundred, and it has not probably increased much, if any, since then. Previous to 1850, the natives of *Aneityum* were as degraded and savage as on any island of the Pacific; but two missionaries who settled there about the date mentioned began to work a steady and continuous change.

The *Aneityum* people do not live in villages, but separately in the midst of their cultivated patches, which are divided into districts, each containing about sixty. The government is in the hands of chiefs, of whom there are three principal, each having a number of petty chiefs under them. But their power appears limited.

Aneityum, like the other islands of the New Hebrides, is of volcanic origin, and it is surrounded by coral reefs. No minerals have been

found; and in this connection it is worthy of remark that Australians insist that there is a much closer natural affinity between the Now Hebrides and Fiji than there is between the Now Hebrides and New Caledonia, which is an island rich in minerals. Mr Brenchley enumerates the principal indigenous products of Aneityum as bread-fruit, banana, cocoa-nut, horse-chestnut, sago-palm, another species of palm bearing small nuts, sugar-cane, taro—the staple article of food—yams in small quantities, sweet-potatoes, and arrowroot. Of fruits, &c., introduced, the orange, lime, lemon, citron, pine-apple, custard-apple, papaw-apple, melons, and pumpkins, have succeeded. The cotton plant had also been introduced, and promised well; and French beans were grown for the Sydney market. There are more than a hundred species of ferns on the island, and more than a hundred species of fish in the waters surrounding it. But the fish are not all edible, and besides being different from, are inferior to those found in the northern hemisphere. The birds are not very numerous; but butterflies and insects abound, in the case of the latter the list being lengthened by the importation of fleas by Europeans. Among themselves, the natives barter fishing-baskets, nets, sleeping-mats, hand-baskets, pigs, fowls, taro, and cocoa-nuts. With foreigners, they barter pigs, fowls, taro, bananas, cocoa-nuts, sugar-cane, &c., for European clothing, hatchets, knives, fish-hooks, and so forth. Their weapons are spears, clubs, bows and arrows—the spears being rude and very crooked.

Of Tanna, another of the southern division of the group, many interesting notes have been left by Mr Brenchley and Dr Turner. It is about forty or fifty miles from Aneityum, and has a somewhat narrow anchorage, called Port Resolution Bay. On the west side of this bay there is a large and preternaturally active volcano, which pulsates in a regular sequence of eruptions at intervals of five, seven, or ten minutes, night and day, all the year round. The regularity of the eruptions is supposed to be caused by the influx of water into the volcano from a lake which lies at its base. Tanna is nearly circular, and between thirty-five and forty miles across. It is covered with lofty hills, bright with verdure.

Mr Brenchley stated the population at fifteen to twenty thousand; but Dr Turner placed it at only ten or twelve thousand; and Turner, who resided for some months on the island, is likely to be nearer the mark. The people are of middle stature, and of a copper colour naturally, although some of them are as black as New Hollanders, through artificial dyeing of their skins. They are rather better-looking than average Papuans, but make themselves hideous with red paint. The men frizzle their hair, which is oftener light-brown than black in colour; the women wear the hair short, but 'laid out in a forest of little erect curls about an inch and a half long.' They pierce the septum of the nose, and insert horizontally a small piece of wood; and in their ears they wear huge ornaments of tortoise-shell. They do not tattoo. The women wear long girdles, hanging to the knee, made of the dried fibre of banana stalks; and the men wear an unsightly waistcloth of

matting. Their weapons are clubs, bows and arrows, and spears, with which they are very expert, and they always work and sleep with their weapons by their sides. They are, in fact—or were, when Dr Turner lived among them—a race of warriors, for the tribes were incessantly at war with each other. 'We were never able,' says Dr Turner, 'to extend our journeys above four miles from our dwelling at Port Resolution. At such distances we came to boundaries which were never passed, and beyond which the people spoke a different dialect. At one of these boundaries, actual war would be going on; at another, kidnapping and cooking each other; and at another, all might be peace, but, by mutual consent, they had no dealings with each other. . . . When visiting the volcano one day, the natives told us about a battle in which one party which was pursued ran right into the crater, and there fought for a while on the downward slope inside the cup!'

The climate of Tanna is damp for four months of the year, when fever and ague are common; but it is agreeable during the remainder of the year; and the average annual temperature is about eighty-six degrees. The soil, on account of the volcanic origin, is extremely fertile, and there are a number of boiling springs.

Erromango, to the north of Tanna, is celebrated for its massacres of missionaries and white settlers, and it was here that Mr Williams was murdered many years ago. This island is covered with dense vegetation down to the very water's edge. It contains a great deal of fine timber, such as sandal-wood, kauri pine, &c. The population was estimated at about five thousand by both Mr Brenchley and Dr Turner. The people are very much like the Tannese, but are without any settled villages or considerable chiefs. The Erromangan women tattoo the upper part of their bodies, and wear leaf-girdles hanging from waist to heel; but the men prefer nudity. Neither infanticide nor euthanasia seems to prevail here, but the sick are not particularly well cared for. Dr Turner traced a belief in witchcraft and some belief in a future state. The spirits of the dead are supposed to go eastward, and some are thought to roam about in the bush.

Vaté or Sandwich Island, still to the north, is another interesting member of the group. It has attracted many Australians and others, who have attempted settlements, but not, we believe, with success as yet. Dr Turner calls it a 'lovely island'—although, whether it compares with the island of Aurora, one of the most northerly of the group, which Mr Walter Coote says is a perfect earthly paradise, we cannot tell. Vaté, at any rate, is very lovely, and seems to be of coral formation. Its size is about one hundred miles in circumference, and its population perhaps ten thousand—although Dr Turner said twelve thousand. There is no general king, but a large number of petty chiefs. The people are more fully clothed than those of the other islands we have referred to; they do not tattoo—they only paint the face in war; they wear trinkets and armlets; and they live in regular villages. There are several dialects, but not such diversity as in Tanna. They do not fight so much as the Tannese; but have clubs, spears, and poisoned

arrows. Infanticide, unfortunately, is prevalent, and seems to be the consequence of the practice of the women having to do all the plantation and other hard work.

In *Vaté*, they have no idols, and they say that the human race sprang from stones and the earth. The men of the stones were *Natamoki nefat*, and the men of the earth *Natamoki natana*. The native name of the island is *Efat or Stone*—which has been corrupted into *Vaté*. The principal god is *Supu*, who created *Vaté* and everything on it; and when a person dies, he is supposed to be taken away by *Supu*. Ancestor-worship is also practised, and the aged were often buried alive at their own request.

The island of *Vaté* is high above the sea, of an irregular outline, and distinguished by some fine bold features. 'We could see,' says Mr Breuchley, 'high mountains, whose summits seemed clad with verdure, while the thick woods towards their base formed, as it were, a girdle which spread downwards as far as the beach.' Ashore, he saw high reed-grass, wild sugar-canes ten feet high, and vast plantations of banana and coconut. The soil is of remarkable fertility; but the island is subject to frequent shocks of earthquake, sometimes very violent. The climate is damp, but not unhealthy. Of the natives, we have read differing accounts, one describing them as among the best, and another as among the worst of New Hebridean aborigines, with a remarkably developed and insatiable craving for human flesh. The happy mean is probably near the truth, that is to say, they are neither better nor worse than the rest of their race, and are very much as the visitor makes them.

BY ORDER OF THE LEAGUE.

BY FRRED. M. WHITE.

IN TWENTY CHAPTERS.—CHAP. XII.

COOLLY, as if the whole transaction had been a little light recreation, and untroubled in conscience, as if the fatal card had fallen to Maxwell by pure chance, instead of base trickery, *Le Gautier* turned his steps in the direction of *Fitzroy Square*. It was a matter of supreme indifference to him now whether Maxwell obeyed the dictum of the League or not; indeed, flat rebellion would have suited his purpose better, for in that case he would be all the sooner rid of; and there was just a chance that the affair with *Vici* might end favourably; whereas, on the other hand, a refusal would end fatally for the rash man who defied the League. Men can face open danger; it is the uncertainty, the blind groping in the dark, that wears body and mind out, unstrains the nerves, and sometimes unseats reason. Better fight with fearful odds, than walk out with the shadow of the sword hanging over one night and day. The inestimable Frenchman had seen what defiance to the League generally came to; and as he reviewed his rosy prospects, his bright thoughts lent additional flavour to his cigarette. Nevertheless, his heart beat a trifle faster as he pulled the bell at the quiet house in *Ventnor Street*.

Adventures of this sort were nothing novel to him; but he had something more at stake here than the fortunes of the little blind boy and the light intrigue he looked for. Miss *St Jean* was in, he found; and he was shown up to her room, where he sat noting the apartment—the open piano, and the shaded waxlights, shining softly—just the proper amount of light to note charms by, and just dim enough to unite confidences. As he noted these things, he smiled, for *Le Gautier* was a connoisseur in the graceful art of love-making, and boasted that he could read women as scholars can expound abstruse passages of the earlier classics, or think they can, which pleases them equally. In such like case, the Frenchman was about to fall into a similar error, never dreaming that the artistically arranged room with its shaded lights was a trap to catch his soul. He waited impatiently for the coming fair one, knowing full well that she wished to create an impression. If such was her intention, she succeeded beyond expectation.

With her magnificent hair piled up upon her small shapely head, and its glossy blackness relieved only by a single diamond star, shining like a planet on the bosom of the midnight sky, with a radiant smile upon her face, she came towards him. She was dressed in some light shimmering material, cut low upon the shoulders; and round the corsage was a wreath of deep red roses, a crimson ribbon round the neck, from which depended a diamond cross. She came forward murmuring a few well-chosen words, and sank into a chair, waiting for *Le Gautier* to recover.

He had need of time to recover his scattered senses, for, man of the world as he was, and acquainted with beauty as he was, he had never seen anything like this before. But he was not the sort to be long taken aback; he raised his eyes to hers with a mute homage which was more eloquent than words. He began to feel at home; the dazzling loveliness threw a spell upon him, the delicious mystery was to his liking; and he was *tête-à-tête*.

'I began to think I had failed to interest you sufficiently last night,' *Isodore* commenced, waving her fan slowly before her face. 'I began to imagine you were not coming to take pity on my loneliness.'

'How could you dream such a thing?' *Le Gautier* replied in his most languishing voice. His pulses began to beat at these last words. 'Did I not promise to come? I should have been here long since, but sordid claims of business detained me from your side.'

'It must have been pressing business,' *Isodore* laughed archly. 'And pray, what throne are you going to rock to its foundations now?'

Had *Le Gautier* been a trifle less vain, he would have been on his guard when the conversation took so personal a turn; but he was flattered; the question betokened an interest in himself. 'How would it interest you?' he asked.

'How do you know that it would not? Remember, that though I am bound by no oath, I am one of you. Anything connected with the League, anything connected with yourself, cannot fail to interest me.'

The words ran through Le Gautier's frame like quicksilver. He was impulsive and passionate; these few minutes had almost sufficed to seal his thralldom. He began to lose his head. 'You flatter me,' he said joyously. 'Our business to-night was short; we only had to choose an avenging angel.'

'For Visci, I suppose?' Isodore observed with some faint show of interest. 'Poor man! And upon whom did the choice fall?'

'A new member, curiously enough. I do not know if you are acquainted with him: his name is Maxwell.'

'May he prove as true to the cause as—as you are. I have never had the fortune to be present on one of these occasions. How do you manage it? Do you draw lots, or do you settle it with dice?'

'On this occasion, no. We have a much fairer plan than that. We take a pack of cards; they are counted, to see if they are correct; then each man present shuffles them; a particular one represents the fatal number, and the president of the assembly deals them out. Whoever the chosen one falls to has to do the task in hand.'

'That, I suppose, must be fair, unless there is a conjurer presiding,' Isodore observed reflectively.—'Who was the president to-night?'

'I myself. I took my chance with the others, you must understand.'

Isodore did not reply, as she sat there waving her fan backwards and forwards before her face. Le Gautier fancied that for a moment a smile of bitter contempt flashed out from her eyes; but he dismissed the idea, for, when she dropped the fan again, her face was clear and smiling.

'I am wearying you,' she said, 'by my silly questions. A woman who asks questions should not be allowed in society; she should be shut away from her fellow-creatures, as a thing to be avoided. I am no talker myself, at least not in the sense men mean.—Shall I play to you?'

Le Gautier would have asked nothing better than to sit there feasting his eyes upon her matchless beauty; but now he assented eagerly to the suggestion. Music is an accomplishment which forces flirtation; besides which, he could stand close to her side, turning over the leaves with opportunities which a quiet conversation never furnishes. Taking him at his word, she sat down at the instrument and commenced to play. It might have been brilliant or despicably bad, opera or oratorio, anything to the listener; he was far too deeply engrossed in the player to have any sense alive to the music. Perfectly collected, she did not fail to note this, and when she had finished, she looked up in his passionate face with a glance melting and tender, yet wholly womanly. It took all Le Gautier's self-command to restrain himself from snatching her to his heart in his madness and covering the dark face with kisses. He was reckless now, too far gone to disguise his admiration, and she knew it. With one final crash upon the keys she rose from her seat, confronting him.

'Do not leave off yet,' he urged, and saying this, he laid his hand upon her arm. She started, trembling, as if some deadly thing had stung her. To her it was a sting; to him, the evidence of awaking passion, and he, poor fool, felt his heart beat faster. She sat down again, panting a little,

as from some inward emotion. 'As you please,' she said. 'Shall I sing to you?'

'Sweeter than the voice of the nightingales to me!' he exclaimed passionately. 'Yes, do sing. I shall close my eyes, and fancy myself in paradise.'

'Your imagination must be a powerful one.—Do you know this?'

Isodore took a piece of music from the stand, a simple Italian air, and placed it in his hands. He turned over the leaves carelessly, and returned it to her with a gesture of denial. There was a curious smile upon her lips as she sat down to sing, a smile that puzzled and bewildered him.

'Do you not know it?' she asked, when the last chords died away.

'Now you have sung it, I think I do. It is a sentimental sort of thing, do you not think? A little girl I used to know near Rome sang it to me. She, I remember, used to imagine it was my favourite song. She was one of the romantic schoolgirls, Miss St Jean, and the eyes she used to make at me when she sang it are something to be remembered.'

Isodore turned her back sharply and searched among the music. If he could only have seen the bitter scorn in the face then—scorn partly for him, and wholly for herself. But again she steered herself.

'I daresay you gave her some cause, Mousieur Le Gautier,' she said. 'You men of the world, flitting from place to place, think nothing of breaking a country heart or two. You may not mean it, perhaps, but so it is.'

'Hearts do not break so easily,' Le Gautier replied lightly. 'Perhaps I did give the child some cause, as you say. *Pardieu!* a man tied down in a country village must amuse himself, and a little unsophisticated human nature is a pleasant chance. She was a little spitfire, I remember, and when I left, could not see the matter in a reasonable light. There is still some bitter vengeance awaiting me, if I am to believe her words.'

'Then you had best beware. A woman's heart is a dangerous plaything,' Isodore replied. 'Do you never feel sorry, never experience a pang of conscience after such a thing as that? Surely, at times you must regret?'

'I have heard of such a thing as conscience,' Le Gautier put in airily; 'but I must have been born before they came into fashion. No, Miss St Jean, I cannot afford to indulge in luxuries.'

'And the League takes up so much of your time. And that reminds me. We have said nothing yet about your insignia. I may tell you now that it is not yet in my hands; but I shall obtain it for you. How bold, how reckless you were that night, and yet I do not wonder! At times, the sense of restraint must bear heavy upon a man of spirit.'

'Thank you, from the bottom of my heart,' Le Gautier fervently exclaimed. 'You are too good to me.—Yes,' he continued, 'there are times when I feel the burden sorely—times like those present, let us say, when I have a foretaste of happier things. If I had you by my side, I could defy the world.'

Isodore looked at him and laughed, her wonderful magnetic smile making her eyes aglow and full of dazzling tints.

'That could not be,' she said. 'I would have no divided attentions; I would have a man's whole heart, or nothing. I have too long been alone in the world not to realise what a full meed of affection means.'

'You should have all mine!' Le Gantier cried, carried away by the torrent of his passions. 'No longer should the League bind me. I would be free, if it cost ten thousand lives! No chains should hold me then, for, by heaven, I would not hesitate to betray it!'

'Hush, hush!' Isodore exclaimed in a startled whisper. 'You do not understand what you are saying. You do not comprehend the meaning of your words. Would you betray the Brotherhood?'

'Ay, if you but say the word—ten thousand Brotherhoods.'

'I am not bound by solemn oath like you,' Isodore replied sadly; 'and at times I think it could never do good. It is too dark and mysterious and too violent to my taste; but you are bound in honour.'

'But suppose I was to come to you and say I was free?' Le Gantier asked hoarsely. 'To tell you that my hands were no longer fettered—what words would you have to say to me then—Marie?' He hesitated before he uttered the last word, dwelling upon it in an accent of the deepest tenderness. Apparently, Isodore did not notice, for her eyes were sad, her thoughts evidently far away.

'I do not know what I should say to you—in time.'

'Your words are like new life to me,' Le Gantier exclaimed; 'they give me hope and strength, and in my undertaking I shall succeed.'

'You will do nothing rash, nothing headstrong, without telling me. Let me know when you are coming to see me again, and we will talk the matter over; but I fear, without treachery, you never can be free.'

'Anything to be my own master!' he retorted fervently. 'Good-night, and remember that any step I may take will be for you.' With a long lingering pressure of the hand and many burning glances, he was gone.

Isodore heard his retreating footsteps echoing down the stairs, and thence along the silent street. The mask fell from her face; she clenched her hands, and her countenance was crossed with a hundred angry passions. Valerie entering at that moment, looked at her with something like fear.

'Sit down, Valerie,' Isodore whispered hoarsely, in a voice like the tones of one in great pain, as she walked impatiently about the room, her hands twisted together convulsively. 'Do not be afraid; I shall be better presently. I feel as if I want to scream, or do some desperate thing to-night. He has been here, Valerie; how I enstained myself, I cannot tell.'

'Did he recognise you?' Valerie asked timidly.

'Recognise me? No, indeed! He spoke about the old days by the Mattio woods, the old times when we were together, and laughed at me for a romantic schoolgirl. I nearly stabbed him then. There is treachery afoot; his plan is prospering. As I told you it would be, Maxwell is chosen for the Roman mission; but he will

never do the deed, for I shall warn Visei myself. And he was my brother—Visei's friend!'

'But what are you going to do now?' Valerie asked.

'He is a traitor. He is going to betray the League, and I am going to be his confidant. I saw it in his face. I wonder how I bear it—I wonder I do not die! What would they say if they saw Isodore now?—Come, Valerie, come, and hold me tightly in your arms—tighter still. If I do not have a little pity, my poor heart will break.'

Long and earnestly did Salvarini and Maxwell sit in the latter's studio discussing the events of the evening, till the fire had burnt down to ashes and the clock in the neighbouring steeple struck three. It was settled that Maxwell should go to Rome, though with what ulterior object they did not decide. Time was in his favour, the lapse of a month or so in the commission being a matter of little object to the League. They preferred that vengeance should be deferred for a time, and that the blow might be struck when it was least expected, when the victim was just beginning to imagine himself safe and the matter forgotten.

'I suppose I had better lose no time in going?' Maxwell observed, when they had discussed the matter thoroughly. 'Time and distance are no objects to me, or money either.'

'As to your time of departure, I should say as soon as possible,' Salvarini replied; 'and as to money, the League finds that.'

'I would not touch a penny of it, Luigi—no, not if I was starving. I could not soil my fingers with their blood-money.—What do you say to my starting on Monday night? I could get to Rome by Thursday morning at the latest.—And yet, to what good? I almost feel inclined to refuse, and bid them do their worst.'

'For heaven's sake, do not!' Salvarini implored. 'Such a thing is worse than folly. If you assume a readiness to fulfil your undertaking, something may turn up in your favour.'

Maxwell gazed moodily in the dead ashes, and cursed the hot-headed haste which had placed him in that awful position. Like every right-minded man, he shrank with horror from such a cowardly crime.

'You will never attain your ends,' he said. 'Your cause is a noble one; but true liberty, perfect freedom, turns against cold-blooded murder; for call it what you will, it is nothing else.'

'You are right, my friend,' Salvarini mournfully replied. 'No good can come of it; and when reprisals come, as they must, they shall be swift and terrible.—But Frederick,' he continued, laying his hand on the other's shoulder, 'do not blame me too deeply, for I will lay down my own life cheerfully before harm shall come to you.'

Maxwell was not aware that Sir Geoffrey Charteris was a member of the League, as Le Gantier had taken care to keep them apart, so far as business matters were concerned, only allowing the baronet to attend such meetings as were perfectly harmless in their general character, and calculated to inspire him with admiration of the philanthropic schemes and self-denying usefulness of the Brotherhood; nor was it

the Frenchman's intention to admit him any deeper into its secrets; indeed, his admission only formed part of the scheme by which the baronet, and through him his daughter, should be entirely in the Frenchman's power. The cards were sorted, and, once Maxwell was out of the way, the game was ready to be played. All this the artist did not know.

With a heavy heart and a foreboding of coming evil, he made the simple preparations for his journey. He had delayed to the last the task of informing Enid of his departure, partly from a distaste of alarming her, and partly out of fear. It would look more natural, he thought, to break it suddenly, merely saying he had been called to Rome on pressing business, and that his absence would not be a prolonged one. Till Saturday, he put this off, and then, bracing up his nerves, he got into his cab, and was driven off rapidly in the direction of Grosvenor Square. He was roused from his meditations by a shock and a crash, the sound of broken glass, the sight of two plunging horses on the ground—roused by being shot forward violently, by the shouts of the crowd, and above all, by the piercing scream of a woman's voice. Scrambling out as best he could, he rose to his feet and looked around. His cab had come violently in collision with another in the centre of Piccadilly. A woman had attempted to cross hurriedly; and the two cabs had swerved suddenly, coming together sharply, but not too late to save the woman, who was lying there, in the centre of an eager, excited crowd, perfectly unconscious, the blood streaming down her white face, and staining her light summer dress. A doctor had raised her a little, and was trying to force some brandy between the clenched teeth, as Maxwell pushed his way through the crowd.

'Nothing very serious,' he said, in answer to Maxwell's question. 'She is simply stunned by the blow, and has sustained, I should say, a simple fracture of the right arm. She must be moved from here at once.—If you will call a cab, I will take her to a hospital.'

'No, no!' Maxwell cried, moved to pity by the pale fair face and slight girlish figure. 'I am mainly responsible for the accident, and you must allow me to be the best judge. My cab, you see, is almost uninjured; put her in there, and I will tell you where to drive.'

They lifted the unconscious girl and placed her tenderly on the seat. There were warm hearts and sympathetic hands there, as you may notice on such occasions as these, and there was a look of feeling in every face as the cab drove slowly away.

'Go on to Grosvenor Square,' Maxwell instructed his man. 'Drive slowly up New Bond Street. We shall be there as soon as you.'

They arrived at Sir Geoffrey's house together, considerably astonishing the footman, as, without ceremony, they carried the sufferer in. Alarmed by strange voices and the shrieks of the servants, who had come up at the first alarm, Enid made her appearance to demand the meaning of this unseemly noise; but directly she heard the cause, as coherently as Maxwell could tell her, her face changed, and she became at once all tenderness and womanly sympathy.

'I knew you would not mind, darling,' he

whispered gratefully. 'I hardly knew what to do, and it was partly my fault.'

'You did quite right. Of course I do not mind. Fred, what do you take me for?' She knelt down beside the injured woman there in the hall, in the presence of all the servants, and helped to carry her up the stairs.

Lucrece looked on for a moment, and then a startled look came in her face. 'Ah!' she exclaimed, 'I know that face—it is Linda Despard.'

Enid heard these words, but did not heed them at the time. They carried the girl into one of the rooms and laid her on the bed. At a sign from the doctor, the room was cleared, with the exception of Enid and Lucrece, and the medical man proceeded to look to the broken limb. It was only a very simple fracture, he said. The gravest danger was from the shock to the system and the wound upon the forehead. Presently, they got her comfortably in bed, breathing regularly, and apparently asleep. The good-natured doctor, waving aside all thanks, left the room, promising to call again later in the day.

FOUNDLING QUOTATIONS.

QUOTATIONS play no small part in conversation and general literature. There are some which we know must inevitably be made under certain circumstances. It is almost impossible, for instance, for the conventional novelist, when he wants to convey to his readers the fact that his heroine's nose is of a particular order—which, formerly, through our lack of invention, we could only describe by a somewhat ungraceful term—to avoid quoting Lord Tennyson's description of the feature as it graced Lynette's fair face—'Tip-tilted like the petal of a flower.' We feel sure that it must come; and there is now, happily, no occasion for a young lady in the position of one of Miss Braddon's earlier heroines, when listening to a detailed description of her appearance, to interrupt the speaker, as he is about to mention the characteristics of her nose, with a beseeching, 'Please, don't say pug!'

And then, does anybody ever expect to read a description of a certain celebrated Scotch ruin, without being told that

If thou wouldst view fair Melrose aright,
Go visit it by the pale moonlight?

or to get through an account of the ancient gladiatorial games at Rome without coming across the line,

Butchered to make a Roman holiday?

You know, perhaps, what praise Mark Twain took to himself because he did not quote this line. 'If any man has a right,' he says, 'to feel proud of himself and satisfied, surely it is I; for I have written about the Coliseum, and the gladiators, the martyrs, and the lions, and yet have never used the phrase, "Butchered to make a Roman holiday." I am the only free white man of mature age who has accomplished this since Byron originated the expression.' This little piece of self-congratulation rather reminds one of the lady

who was accused of never being able to write a letter without adding a P.S. At last, she managed to write one without the usual addition; but when she saw what she had succeeded in doing, she wrote: 'P.S.—At last, you see, I have written a letter without a P.S.' And so, though Mark Twain managed to steer clear of the hackneyed quotation in the body of his account, he could not help running against it in a P.S.

Then we have all the multitude of Shakspearean quotations which are sure to be heard in their accustomed places, many of which, indeed, have become—to quote again—such 'household words,' that to very many people they do not appear to be quotations at all, but merely every-day expressions, of the same order as 'A fine day' or 'A biting wind.'

Again, when we read of some cheerful fireside scene, when the curtains are drawn closely against the winter wind that is roaring round the house, and the logs are crackling and spitting in the grate, and the urn is hissing and steaming upon the table, don't we know that a reference to the 'cup which cheers but not inebriates' is certainly coming? This, by the way, is a line that is almost invariably incorrectly quoted, and it is the usual and incorrect form that we have given. We shall leave our readers to turn up the line for themselves, and see what the correct form is, and then, perhaps, the trouble they will thereby have had will serve to impress it upon their minds, and prevent them again quoting it incorrectly.

But it was not with the intention of talking about these well-known and every-day quotations from Tennyson, Scott, Byron, Shakspeare, and Cowper that we thought of writing this paper. We want to talk about a few quotations, quite as well known as those to which we have already alluded, which have been so bandied about that all trace, or nearly all trace, of their original parish and paternity has been lost; and, though they are as familiar to us as the most hackneyed phrases from our best known poets, no one can say with certainty by whom they were first spoken or written.

A good many vagaries have been made as to the source of the well-known and much-quoted couplet:

He that fights and runs away,
May live to fight another day.

The popular belief is that they are to be found in Butler's *Hudibras*. But the pages of that poem may be turned over and over again, and the lines will not be found in them. We may as well say at once that they cannot be found anywhere in the exact form in which they are usually quoted. The late Mr James Yeowell, formerly sub-editor of *Notes and Queries*, once thought that he had discovered their author in Oliver Goldsmith, as a couplet, varying very slightly from the form we have given, occurs in *The Art of Poetry on a New Plan*, which was compiled by Newbery—the children's publisher—more than a century ago, and revised and enlarged by Goldsmith. But the lines are to be found in a book that was published some thirteen years before *The Art of Poetry*, namely, Ray's *History of the Rebellion*. There they appear as a quotation, and no hint is given as to the source from which they are taken.

Ray gives them as follows (first edition, 1749, page 54):

He that fights and runs away,
May turn and fight another day.

Though this is the earliest appearance in print of the exact words, or almost the exact words, in which the quotation is now usually given, it is by no means the earliest appearance of a similar thought. Even as far back as Demosthenes we find it. It appears, too, in Scarron, in his *Virgile Travesté*, if we remember rightly. And now we must confess that the still prevailing belief that the lines occur in *Hudibras* is not entirely without a *raison d'être*, and it is not impossible that Ray may have thought he was quoting Butler, preserving some hazy and indistinct recollection of lines read long ago, and putting their meaning, perhaps quite unwittingly and unconsciously, into a new and unauthorised form. This, however, is mere conjecture. The lines, as they appear in *Hudibras* (part iii. canto iii., lines 243, 244), are as follows:

For those that fly, may fight again,
Which he can never do that's slain.

We may just add that Collet, in his *Relics of Literature*, says that the couplet occurs in a small volume of miscellaneous poems by Sir John Mennis, written in the reign of Charles II. With this book, however, we are unacquainted, and cannot, therefore, discuss the appearance of the founding lines in it, or what claims its author may have to be their legitimate parent.

All readers of Tennyson—and who that reads at all is not numbered amongst them?—know well the opening stanza of *In Memoriam*:

I held it truth, with him who sings
To one clear harp in divers tones,
That men may rise on stepping-stones
Of their dead selves to higher things.

These lines contain another quotation of the order we have designated as 'Foundling Quotations.' Who is the singer, 'to one clear harp in divers tones,' to whom Lord Tennyson refers? Passages from Seneca and from St Augustine (Bishop of Hippo) have been suggested as inspiring the poet when he penned the lines; but neither Seneca nor St Augustine can be said to sing 'to one clear harp in divers tones.' Perhaps the most reasonable hypothesis is that Lord Tennyson had in his mind Longfellow's beautiful poem of *St Augustine's Ladder*, the opening lines of which are:

Saint Augustine! well hast thou said,
That of our vices we can frame
A ladder, if we will but tread
Beneath our feet each deed of shame!

and the closing ones:

Nor deem the irrevocable Past
As wholly wasted, wholly vain,
If, rising on its wrecks, at last
To something nobler we attain.

The question, however, though Lord Tennyson is still alive, is one that is not likely ever to be clearly solved; for we have very good authority for saying that he has himself quite forgotten of what poet or verses he was thinking when he composed the first stanza of *In Memoriam*.

The equally well-known

This is truth the poet sings,
That a sorrow's crown of sorrow is remembering happier things,

in *Locksley Hall*, refers, of course, to the line in Dante's *Inferno*.

The trite 'Not lost, but gone before,' might alone provide subject-matter for a fairly long essay. Like the other quotations which we are discussing, it can be definitely assigned to no author. The thought can be traced back as far as the time of Antiphanes, a portion of whose eleventh 'fragment,' Cumberland has translated, fairly literally, as follows:

Your lost friends are not dead, but gone before,
Advanced a stage or two upon that road
Which you must travel, in the steps they trod.

Seneca, in his ninety-ninth Epistle, says: 'Quem putas periisse, premissus est' (He whom you think dead has been sent on before); and he also has: 'Non amittuntur, sed premittuntur' (They are not lost, but are sent on before), which corresponds very closely with the popular form of the quotation. Cicero has the remark that 'Friends, though absent, are still present'; and it is very probable that it is to this phrase of Cicero that we are really indebted for the modern, 'Not lost, but gone before.' We may note that Rogers, in his *Human Life*, has, 'Not dead, but gone before.'

Then there is the somewhat similar, 'Though lost to sight, to memory dear,' which no one has succeeded in satisfactorily tracing to its original source. It was said, some years ago, that the line was to be found in a poem published in a journal whose name was given as *The Greenwich Magazine*, in 1701, and written by one Ruthven Jenkyns. The words formed the refrain of each stanza of the poem. We give one of them as a sample:

Sweetheart, good-bye! the fluttering sail
Is spread to waft me far from thee;
And soon before the favouring gale
My ship shall bound upon the sea.
Perchance all desolate and forlorn,
These eyes shall miss thee many a year,
But forgotten every charm—
Though lost to sight, to memory dear.

Mr Bartlett, however, in the last edition of his *Dictionary of Quotations*, has demolished this story of Mr Ruthven Jenkyns; and the line is still unclaimed and fatherless. Probably, as in the case of the last mentioned, 'Not lost, but gone before,' its germ is to be found in an expression of Cicero.

There is a Latin line familiar to all of us, 'Tempora mutantur, nos et mutamur in illis' (The times change, and we change with them), which we are frequently hearing and seeing. This is a much-abused line; probably there is none more so; and we do not think we shall be guilty of exaggeration if we say that it is misquoted ten times for every time it is correctly cited. The positions of the *nos* and the *et* are usually interchanged; the result being, of course, a false quantity; for the line is a hexameter. Now, who first wrote this line? The answer must be, as in the cases of all our other 'Foundling Quotations,' that we do not know. But in this particular instance we may venture to be

a little more certain and definite in our remarks concerning its pedigree than we have dared to be in previous ones. There can be little doubt that the line is a corruption of one to be found in the *Delitiae Poetarum Germanorum* (vol. i. page 685), amongst the poems of Matthias Borbonius, who considers it a saying of Lotharius I., who flourished, as the phrase goes, about 830 A.D. We give the correct form of the line in question, and the one which follows it:

Omnia mutantur, nos et mutamur in illis;
Illa vires quoadem res habet, illa suas.

There is another founding Latin line, almost as frequently quoted as the one we have just been discussing, namely, 'Quos Deus vult perdere, prius dementat' (Whom the gods would destroy, they first madden). Concerning this there is a note in the fifth chapter of the eighth volume of Mr Croker's edition of Boswell's *Life of Johnson*, in which it is said to be a translation from a Greek iambic of Euripides, which is quoted; but no such line is to be found amongst the writings of Euripides. Words, however, expressing the same sentiment are to be found in a fragment of Athenagoras; and it is most likely that the Latin phrase now so commonly quoted is merely a translation from this writer's Greek, though by whom it was first made we cannot say. The same sentiment has been expressed more than once in English poetry.

Dryden, in the third part of *The Hind and the Panther*, has:

For those whom God to ruin has designed,
He fits for fate, and first destroys their mind.

And Butler writes in *Hudibras* (part iii. canto ii., lines 565, 566):

Like men condemned to thunder-bolts,
Who, ere the blow, become mere dolls.

Further consideration will probably bring to the reader's mind other examples of these 'Foundling Quotations' which have won for themselves an imperishable existence; though their authors, whose names these few-syllabled sentences might have kept alive for ever, if they were only linked the one with the other, are now utterly unknown and forgotten. Any one who can succeed in discovering the real authorship of the quotations we have been considering will win for himself the credit of having solved problems which have long and persistently baffled the most curious and diligent research.

MISS MASTERMAN'S DISCOVERY.

IN TWO CHAPTERS.—CHAP. I.

MISS PHOEBE MASTERMAN was a spinster over whose head some fifty summers had flown— with, it may be presumed, incredible swiftness to herself. She was very comfortably situated with regard to this world's goods, having inherited ample means from her father, a native of Durham, who had made a considerable fortune as a coal-merchant. At the time of her father's death, she was thirty-five; and as she had no near relative in whom to interest herself, she established an Orphanage for twelve girls at Bradborough, a market-town in the north of England, within two miles of the coast. Brought

up in the strictest conformity with Miss Masterman's peculiar views, dressed with the most rigid simplicity, fed on the plainest fare, taught to look upon the mildest forms of recreation as vanity and vexation of spirit, these fortunate orphans, one would think, could hardly fail to become virtuous and happy; yet, inconceivable as it may appear, there were legends that orphans had been seen with red eyes and countenances expressive of anything but content; there was even a dark rumour to the effect that one of them had been heard to declare that if she only had the opportunity she would gladly commit a crime, that she might be sent to prison, and so escape from the thralldom of Miss Masterman!

But even this ingratitude and depravity paled before that of the Rev. Shangan Lambie, incumbent of the little church of St Mary's. Now, Miss Masterman had built that church for the good of the district, and the living was in her own gift. Yet Mr Lambie, entirely ignoring the latter fact, had had the hardihood to baptise an orphan in Miss Masterman's absence without previously obtaining the permission of that lady; upon which the indignant lady declared that unless he promised not to interfere with her orphans, she would withdraw all her subscriptions and leave him to find his own income. Nor was this all. There were other reasons to make Mr Lambie pause before quarrelling with Miss Masterman. Before he was appointed to St Mary's, he had been only a poor curate with a stipend of fifty pounds a year, which unimportant income he had found totally inadequate to his wants and those of an aged mother who was dependent on him; consequently, he had entered upon his duties at Bradborough shackled with small debts to the amount of a hundred pounds.

Miss Masterman, who made a point of inquiring into every one's affairs, soon became aware of this, and as want of generosity was by no means to be numbered among her failings, she rightly judged that it would not be reasonable to expect a man to give his mind to his work if he were weighed down by other cares; so, in an evil hour for himself, poor Mr Lambie accepted from the lady a sum of money sufficient to defray his debts—a sum for which, as he soon found, he would have to pay compound interest in the way of blind obedience to Miss Masterman's behests. Not a funeral could be performed, not a marriage could be solemnised, not an infant could be baptised, without Miss Masterman's permission; and it was even asserted by some that Miss Masterman selected the texts for the poor man's sermons! The only oasis in his desert was the annual departure of Miss Masterman for change of air; then, and then only, did Mr Lambie breathe in peace. For a brief period, he felt that he was really master of himself. He could sit down and smoke his pipe without fear that his sitting-room door would be rudely flung open by an imperious female of fierce aspect, who would lecture him on his sinful extravagance in the use of tobacco, when he couldn't pay his debts.

One bright August morning, Miss Masterman was seated at her breakfast table, and having concluded her meal, had taken up the morning

paper and was studying the advertisements, holding the paper at arm's-length with an air of grim combativeness, as if she were prepared to give battle to any or all the advertisers who did not offer exactly what she sought. Suddenly, she pounced upon the following: 'A Home is offered in a Country Rectory by a Rector and his family for two or three months to a Single Lady needing change of air. House, with large grounds, conservatories, pony-carriage, beautiful scenery.—Address, Rector, Clerical Times Office.'

'That will do,' said Miss Masterman to herself; and, with her usual promptitude, she sat down then and there and wrote to the advertiser, asking particulars as to terms, &c. And in due course she received an answer so perfectly satisfactory in every respect, that the end of the month found her comfortably installed in the charming rectory of Sunnysdale, in the county of Hampshire, in the family of the Rev. Stephen Draycott, rector of Sunnysdale.

The rector's family, besides himself and his wife, consisted of two sons and two daughters, all grown up, with the exception of Master Hubert, a boy of ten years old, who was endowed with such a remarkable fund of animal spirits that he was the terror of the neighbourhood; and from the first moment of Miss Masterman's arrival, he became the special *beute noire* of that lady. With all the other members of the family, Miss Masterman was much pleased. The rector himself was a polished and dignified person, and by the extreme, if rather laboured, courtesy of his manners, he endeavoured to tone down the somewhat exuberant spirits of the rest of his family. Mrs Draycott was a gentle, refined matron, with a sweet, though rather weary face, and was simply adored by her husband and children. The two daughters, Adela and Magdalen, were charming girls, full of fun, and very popular with their two brothers, of whom the senior, Clive, was aged nineteen.

To the young people, Miss Masterman's arrival was little short of a calamity; they were so much in the habit of freely stating their opinions on all subjects without restraint, that the presence of a stranger appeared to them an unmitigated bore. It was in vain that their mother reminded them that the handsome sum paid by Miss Masterman for her board would be a very desirable addition to the family exchequer. At a sort of cabinet council held after she had retired to her room the first night after her arrival, Master Hubert expressed, in schoolboy slang, his conviction that she was a 'ghastly old crumpet'; a nickname which she retained until a servant one day brought in a letter which, she said, was addressed to 'Miss Pobe Masterman'; from which moment, Miss Masterman went by the name of 'Pobe' till the end of her visit—a piece of irreverence of which that lady happily remained quite unconscious.

By the time Miss Masterman had settled down in her new abode, the principal ladies of the parish came to call upon her; and as some of them were not only rich but very highly connected, Miss Masterman greatly appreciated their kind attentions. Among them was a Lady O'Leary, an Irish widow, with whom Miss Masterman soon struck up a great intimacy.

Lady O'Leary was generally believed to be a person of large fortune; but as this supposition was based entirely on her own representations with regard to property in Ireland, there were some sceptical spirits who declined to believe in it as an established fact. Lady O'Leary shared three furnished rooms with a Miss Moore, who lived with her as companion; and it soon became quite an institution for Miss Masterman to take tea with her two or three times a week at least. On these occasions, the two ladies—for Miss Moore discreetly withdrew when Lady O'Leary had visitors—discussed all the affairs of the parish, until, by degrees, they got upon such thoroughly confidential terms, that before long they had imparted to each other their joint conviction that the general moral tone of the parish was lamentably low, and that it was doubtless owing in a great measure to the deplorably frivolous conduct of the family at the rectory; for Miss Masterman had discovered, to her amazement and horror, that the rector not only permitted his daughters to read Shakspeare, but even gave them direct encouragement to do so. Nor was this all; he actually was in the habit, once a year, of taking all his children up to London to see the pantomime at Drury Lane!

Among the more frequent visitors at the rectory was a Mrs Penrose, an exceedingly pretty young widow, who had recently taken a small house in the village, where she lived very quietly with an old servant, who appeared greatly attached to her mistress. The widow, who was apparently not more than five-and-twenty, was a charming brunette, with sparkling black eyes, and hair like waves of shining brown satin; and her sweet face and animated manners made her generally very popular in the village, where she visited the poor and assisted the rector in various parochial works of charity. Especially was she a favourite at the rectory, not only with Mr and Mrs Draycott, but with the young people, her presence in the family circle invariably giving rise to so much hilarity, that even the rector was attracted by the general merriment, and would leave his study to come and sit with his family, and allow himself to join in their mirth at Mrs Penrose's lively sallies. Indeed, he had even been heard to declare, in Miss Masterman's hearing, to that lady's unspeakable disgust, that when he was fagged and worried with the necessary work of a parish, a few minutes of Mrs Penrose's cheerful society acted on his mind like a tonic.

Miss Masterman, from the first, had taken an extraordinary antipathy to Mrs Penrose, who appeared to her to be everything that a widow ought not to be! Her bright face and unflagging spirits were a constant offence to the elder lady, though she had often been told that the late Captain Penrose was such a worthless man that his early death, brought about entirely by his own excesses, could be nothing but an intense relief to his young widow, who was now enjoying the reaction, after five years of married misery. Miss Masterman's dislike to Mrs Penrose was fully shared by her friend Lady O'Leary; and they both agreed that the widow was in all probability a designing adventuress, and deplored the infatuation which evidently blinded the rector

as to her real character, for, as Lady O'Leary observed: 'Though it was given out that Mrs Penrose was the particular friend of Mrs Draycott, the rector's partiality was obvious!'

Miss Masterman had been at Sunnysdale for six weeks, when one morning she received a letter from her housekeeper, informing her that Mr Lambe had taken upon himself to remark that the orphans were looking pale and jaded, and that he was going to take them all to spend a day at the seaside. Miss Masterman, on reading this letter, felt most indignant, and at once wrote to Mr Lambe to forbid the proposed excursion; and after enumerating the many obligations under which she had laid him—not forgetting the hundred pounds she had lent him—she concluded by expressing her surprise that he should presume to interfere with her special protégées in any way whatever.

To this Mr Lambe replied that he was 'extremely sorry if he had offended Miss Masterman; that he had imagined that she would be pleased for the orphans to have the treat, particularly as some of them looked far from well; but that, having promised the children, it was impossible for him to break his word, particularly as he had ordered a van for their conveyance and made all the necessary arrangements for the trip; he therefore trusted that Miss Masterman would forgive him if he still kept his promise to his little friends.'

Furious at this unexpected opposition to her will, Miss Masterman at once went in search of Mrs Draycott to inform her that it was necessary for her to go home for a week or ten days on business of importance. Finding that Mrs Draycott was not at home, she repaired to the rector's study, and after knocking at the door, and being told to enter, she informed Mr Draycott of her intentions. Saying that she must write home at once, she was about to withdraw, when Mr Draycott courteously asked her if she would not write in the study, to save time, as he was just going out. Miss Masterman thanked him; and as soon as he had gone, sat down and wrote to her housekeeper to say that she would be at home the following day without fail. Having finished her letter, she was about to leave the room, when she observed a note in a lady's handwriting, which had apparently slipped out of the blotting-pad on to the floor. She picked it up, and was about to return it to its place, when the signature, 'Florence Penrose,' caught her eye. 'What can that frivolous being have to say to the rector?' thought Miss Masterman; and feeling that her curiosity was too strong to be resisted, she unfolded the note, and read the following words:

MY DEAR FRIEND—I have just received the diamonds, which are exactly what I wanted. The baby's cloak and hood will do very well. I have now nearly all that I require. My only terror is, lest our secret should be discovered.—In great haste. Yours, as ever, FLORENCE PENROSE.

P.S.—I hope you won't forget to supply me with plenty of flowers.

Here was a discovery! For a few moments Miss Masterman sat motionless with horror; her head was in a whirl, and she had to collect her thoughts before she could make up her mind

what to do. The first definite idea that occurred to her was to secure the note; the next was, to show it to Lady O'Leary and to discuss with her what was to be done. As soon, therefore, as she had completed all her arrangements for her journey on the morrow, she repaired to her friend's lodgings; and after Lady O'Leary had fairly exhausted all the expletives that even her extensive Irish vocabulary could supply, to express her horror and detestation of the conduct of the rector and Mrs Penrose, the two ladies laid their heads together, and seriously discussed the advisability of writing to the bishop of the diocese and sending him the incriminating letter. However, they finally decided to do nothing before Miss Masterman's return to Sunnydale; and in the meantime, Lady O'Leary undertook to be on the watch, and to keep her friend *au courant* as to what was going on in the parish.

It was late that evening when Miss Masterman returned to the rectory, and by going up directly to her room, she avoided meeting the rector. The next morning she pleaded headache as an excuse for having her breakfast sent up to her; and did not come down until, from her window, she had seen Mr Draycott leave the house, knowing he would be away for some hours. He left a polite message with his wife, regretting that he had not been able to say good-bye in person to Miss Masterman.

'The wily hypocrite!' thought that lady. 'He little thinks that his guilt is no secret to me. But such atrocity shall not go unpunished!'

When she took leave of Mrs Draycott, she astonished that lady by holding her hand for some moments as she gazed mournfully into her face; then, with a final commiserating glance, the worthy spinster hurried into her fly. As she drove away, she leant forward and waved her hand to the assembled family with such effusion, that Mrs Draycott exclaimed: 'Dear me, I fear I have done Miss Masterman injustice. I had no idea that she possessed so much feeling as she showed just now. One would really think she was going for good, instead of only ten days!'

'No such luck,' cried the irrepressible Hubert. 'But, at all events, we have got rid of her for a week at least; so now, we'll enjoy ourselves, and forget all about "Pobe" till she turns up again!'—a resolution which the young gentleman did not fail to keep most faithfully.

In the meantime, Miss Masterman was busily employed at Bradborough in quelling orphans and other myrmidons, and reducing things in general to complete subjection to her will; but with regard to Mr Lambie, she found her task more difficult than she expected. In fact, the worm had turned; and on her summoning him to her presence and opening the vials of her wrath on his devoted head, he calmly but firmly announced his intention of sending his resignation to his bishop; which took Miss Masterman so completely by surprise, that, in her bewilderment, she actually asked him to reconsider his decision. But though she even went so far as to give her consent to the orphans having their coveted treat, Mr Lambie's determination was not to be shaken.

The following week flew swiftly away; a good deal of correspondence devolved upon Miss Masterman through having to think of a successor to Mr Lambie, and the lady of the manor was very much worried. At last, however, everything was settled, and Miss Masterman began to think of returning to Sunnydale, where, as she felt, fresh anxieties and most painful duties awaited her.

•POPULAR LEGAL FALLACIES.*

BY AN EXPERIENCED PRACTITIONER.

DEEDS OF GIFT AND WILLS.—I.

ONE of the most universally believed fallacies is that it is better to make a deed of gift than a will for the disposal of property. Nothing can be more dangerous than this delusion, as we have often had occasion to observe in the course of our experience. A deed of gift—pure and simple—is a document under seal evidencing the fact that certain property specified therein has been 'absolutely given by the donor to the donee, without any reservation for the benefit of the former, or any power for him to revoke the gift or resume possession of the property in any circumstances. If the deed contains a condition that the donor shall have the enjoyment of the property during his life, and that he shall have a right to recall the gift thereby made, and dispose of the property in some other way, then the document is to all intents and purposes a will; and if it is only executed and attested as an ordinary deed, it is altogether void, in consequence of non-compliance with the directions contained in the Wills Act, 1837, which very properly requires more precautions against fraud and forgery in the case of a will than in the case of a deed. We say 'very properly,' because the will does not take effect during the lifetime of the testator; and therefore the greatest safeguard is removed by his death before the document can be acted upon or its authenticity be likely to be questioned. This is a common oversight. The deed is prepared and duly stamped; and in consequence of the insertion of the powers alluded to above, it proves to be utterly useless, when, after the decease of the donor, his property is claimed by his heir-at-law and next of kin because of his having died intestate. It may occasion some surprise that any solicitor will prepare a deed which he knows cannot stand the test of litigation; but this is not altogether the fault of the profession. In many cases, the danger is pointed out; but if the donor is determined to dispose of his own property in his own way, who can gainsay him? If he cannot get what he requires in one office, he will go to another; and we have several times lost clients in consequence of our refusal to prepare such a deed; all our arguments being

* It should be understood that this series of articles deals mainly with English as apart from Scotch law.

met by the reply that there would be no duties to pay to the government if the deed were executed; a complete fallacy in many cases, as we have afterwards had occasion to know, when we have seen what followed the decease of the misguided donor.

On the other hand, if there is a genuine gift, and possession is given in accordance with the deed, what then? One case which came under our notice may illustrate the danger against which we have frequently protested in vain. A retired merchant invested the whole of his savings in a freehold estate which would produce sufficient annual income to supply all his wants and leave a good margin for future accumulations. Being a widower, in somewhat infirm health, he took up his residence in the house of his younger son, the elder being an irreclaimable reprobate. Unfortunately, the wife of this younger son was an artful and avaricious woman, whose sole reason for consenting to the arrangement as to residence was the hope of future gain. The old gentleman had an insurmountable objection to making a will—not an uncommon weakness—as it reminded him too forcibly of the time when he would have to leave his fine estate and go over to the great majority. At length, after urgent and repeated representations as to the risk of his estate being sold by his dissipated heir-at-law in case of his dying intestate, he was persuaded to execute a deed of gift to his younger son, to whom at the same time he handed the title-deeds relating to the estate. Soon afterwards, a quarrel arose between the donor and his daughter-in-law; and the latter persuaded her husband—whose moral principles were as weak as those of his brother, though in a different way—to sell the estate, and then turn his father out of his house. After his ignominious dismissal, the poor old gentleman went to the house of a nephew, who soon tired of supporting him; and eventually he was obliged to go into the workhouse, altogether neglected to the time of his death by all his relatives, except his graceless elder son; and alas! he could not assist his aged parent, as he was himself almost destitute. This may appear to be an extreme case; but it is not a solitary one, although it is one of the worst of those which have come under our own observation.

This brief narrative may serve as an introduction to the explanation of one remarkable peculiarity in the practical working of a deed of gift of real estate. Personal property may of course be sold, and the sale completed by delivery of the goods or other chattels to the purchaser; but actual possession of land is no clue to the ownership thereof, the title being evidenced by deeds in the general way, the exceptions being those cases in which land has descended to the heir in consequence of the intestacy of the former owner; and also those cases in which long-continued possession has given an impregnable title to a person who was originally a mere trespasser, or at the most a tenant whose landlord has been lost sight of. When the freehold estate above mentioned was given away and the gift was evidenced by deed and actual possession, the donor lost the power of again giving it away either by deed or by his will. But he might have sold the property if he could have found

a purchaser willing to complete without actual possession of the title-deeds; which, however, he might afterwards have recovered from the holder thereof; the reason for this being, that where there are two inconsistent titles, both derived from the same person, but one depending upon an actual sale and payment by the purchaser of the price agreed upon, while the other rests upon no better foundation than a mere voluntary act on the part of the donor, the title of the purchaser will prevail, because of the valuable consideration which he has paid; while the other person has paid nothing. On the other hand, if the donee, before he is dispossessed or his title superseded by a conveyance for value, were to sell the property, and if the sale were completed and the purchase-money paid, the donor would have lost his right to sell. Having placed the donee in a position to make a good title to the property, he must take the consequences of his own folly. We once had the pleasure of saving for the benefit of the vendor the value of an estate which he had previously given away; greatly to the astonishment of the donee, who supposed himself to be safely possessed of the whole estate.

It will be understood that our remarks have no application to marriage settlements or similar documents in which extensive though limited powers of appointment are generally reserved to the settler, the power extending over the whole estate or a specified part thereof; while the persons to be the beneficiaries are strictly defined; and powers are also given to him to direct the payment of portions to his younger children, and to charge them upon the estate which is comprised in the settlement. This is the legitimate way in which a landed proprietor can provide for his family; and the only serious objection which has ever been made thereto is that it has a tendency to perpetuate the descent of the estates, instead of their distribution and subdivision into smaller properties. But these documents are beyond the scope of this paper. What we strongly object to are voluntary deeds of gift, which are generally made for the purpose of avoiding the payment of legacy and succession duty, but lead too frequently to disastrous consequences. They are beneficial to the legal profession, often leading to costly and harassing litigation; but to the intended recipients of the bounty of the donor, and sometimes to the donor himself, they are in a corresponding degree injurious.

Attention may here be called to the provisions of the Customs and Inland Revenue Act, 1881, on the subject of voluntary gifts of personal property made for the purpose of avoiding the payment of the duties accruing due on the death of the owner of personal estate. By this Act, duty is payable at the like rates as the ordinary probate duty on voluntary gifts which may have been made by any person dying after 1st June 1881, whether such gift may have been made in contemplation of approaching death or otherwise, if the donor has not lived three calendar months afterwards; or by voluntarily causing property to be transferred to or vested in himself and some other person jointly, so as to give such other person benefit of survivorship; or by deed or other instrument not taking effect as a will, whereby

an interest is reserved to the donor for life, or whereby he may have reserved to himself the right, by the exercise of any power, to reclaim the absolute interest in such property. This enactment removes the last argument in favour of deeds of gift, for they do not now have the effect of avoiding the payment of probate duty; and in any event, since 19th May 1853, succession duty has always been payable in respect of the benefit acquired by the successor by reason of the decease of his predecessor in title. The case of a voluntary settlement in respect of which the stamp duty has been paid is provided for by a direction that on production of such deed duly stamped, the stamp duty thereon may be returned. Personal estate includes leasehold property.

With respect to wills, the position is very different. Every man who has any property of any kind ought to make a will, especially if he desires his property to be distributed in any way different from the mode prescribed by law in case of his intestacy. Many cases occur in which the neglect to make a will is not only foolish but positively wrong. A husband has a duty to perform towards his wife which cannot be omitted without culpability; and the same may be said of the duty of a parent to his children. As to the former, there is a danger which is often unsuspected by the owner of real estate. The law provides that on the death of such a person intestate, leaving a widow, she shall be entitled to dower out of such estate; that is to say, one-third of the rents thereof during the remainder of her life; but this right to dower is subject to any disposition which the owner of the estate may have made thereof, or any charges which he may have created thereon. In England, there is no inalienable share of property which the widow and children can claim, even as against the devisee, as is the case in Scotland. But there is a power to bar the right of the widow to her dower by means of a declaration to that effect in the conveyance to a purchaser, or in any deed subsequently executed by him relating to the property. It must be observed that the declaration in bar of dower is not necessary for the purpose of creating charges upon the estate, because dower is expressly made subject to such charges. But if the declaration has been inserted in the conveyance—without the knowledge of the purchaser—his widow will have no claim to any provision out of such estate unless it shall be made for her by the will of her husband, who, in ignorance of the necessity for making a will, dies intestate, thus leaving his widow dependent upon his heir-at-law; in numerous cases, a distant relative, who is not disposed to acknowledge that the widow of his predecessor has any claim upon him.

Again, as to his children, the possessor of real estate ought not to forget that in the case of freehold property it will descend upon his eldest son as heir-at-law; thus leaving his younger sons and his daughters unprovided for except as to their respective shares of his personal estate, which may be of small value, or even insufficient for the payment of his debts. If the property should be copyhold, it would descend to the customary heir, who might be the eldest son,

the youngest son, or all the sons as tenants in common in equal undivided shares; but in any event, the daughters would remain unprovided for.

A DEAD SHOT.

AN INCIDENT IN 1801.

THE following singular story is perhaps worth putting on record because the narrative is strictly true.

In the year 1801, a fine old Jacobean house, known as Chafford House, situated on the borders of Devon and Somerset, was in the occupation of a Mr Edward Leggett, a wealthy farmer, and his two sons. The house, like many of its class, had originally been built so that its ground-plan formed the letter E, a centre, with projecting doorway, and two wings; but one wing had been taken down altogether, as well as a portion of the other, so that the ground-plan became thereby altered and took this form, E, the centre doorway remaining untouched. This should be remembered, in order to understand the circumstances of the principal incident of the narrative. Over the projecting doorway was a room which went by the name of the 'Oratory,' probably on account of its large projecting bay window, which gave it somewhat of an ecclesiastical appearance, and from this window a view could be obtained on all sides. The small part of the wing which was left standing was used as storerooms, and access from the outside was gained by a small door, which had been injudiciously opened in the corner, or angle, when the alterations were made.

Mr Leggett possessed a large quantity of very fine old massive silver-plate, which was placed in one of the storerooms, strongly secured and locked, in the remains of the wing referred to. It was supposed that he had also a considerable sum of money locked up with the plate, as banking was not so common in remote country-places in those days.

Now it happened that, on the 23d of April 1801, Mr Leggett and his two sons had to attend a neighbouring cattle fair, and had proposed to sleep in the town, instead of returning home the same night; but, a good customer having arranged to complete a purchase early the next morning, Mr Leggett's eldest son, George, came back to Chafford very late and went quietly to bed; but the worry of the fair, and anxiety about to-morrow's purchase, prevented him sleeping. His bedroom was at the end of the house, close to the store wing, and just above the little door in the angle already mentioned. Whilst restlessly tossing about from side to side, young Leggett heard the house clock strike two, and just after became aware of a peculiar grating noise, apparently under his window. To jump up and cautiously and silently open the casement was the work of a minute. It was a cloudy moonlight night, just light enough to show objects imperfectly, but enough for George Leggett to observe the figures of two men close to the little door in the angle immediately below, on which they were apparently operating with some cutting tool, which had produced the grating noise he had heard. George, who was a young

man of great intelligence, quick judgment, and ready resource, instantly comprehending the situation, took his measures accordingly. He happened to be a member of the county yeomanry cavalry; and catching up his carbine and some ball cartridges, he silently left his room, and proceeding down the corridor—loading his carbine as he went along—soon reached the 'Oratory' room over the porch, whence he could see straight down on to the little door, which was then right in front of him. Silently opening the casement, he made a careful survey of the position, which a passing ray of moonlight enabled him to take in at a glance.

At the little white-painted door were the two men, whose dark figures were well thrown up by so light a background. One was stooping or kneeling, and the other was standing close behind him, their backs, of course, being turned towards their observer. Putting his carbine on full-cock and laying it carefully on the window-sill, after a deliberate aim, Leggett pressed the trigger. A loud shriek and a stifled cry followed, then all was still. Leggett stood intently watching the spot for several moments; but profound silence prevailed—not a sound was heard, not a movement was perceptible. The only other man in the house was the groom, who was quickly roused; and lanterns having been procured, he and Leggett repaired to the spot, and were not a little staggered to find both burglars lying dead. The hand of one of them still grasped a very large steel centre-bit, with which he had been operating on the door. Subsequent surgical investigation showed that the bullet had struck the back of the first man, passing through his heart, and had then entered the head of the man who was stooping or kneeling in front of him, just behind the ear, lodging in the brain. The bodies were at once removed in-doors; and at the inquest, held the next day, the following particulars were elicited:

By the side of the dead men was found a leather travelling portmanteau, containing a highly finished and elaborate set of house-breaking tools, together with a piece of candle and a preparation of phosphorus for obtaining a light, as it is needless to say that lucifer matches were unknown in 1801, their place being supplied by the old-fashioned flint and steel and tinder-box, articles not available for burglars' use. Each man was armed with a brace of pocket pistols, loaded and primed; and one of them carried a formidable-looking dagger, fitted into the breast of his coat, clearly showing that these ruffians were prepared to offer a desperate resistance, if interrupted or molested. They were both well dressed, and had quite the appearance of gentlemen. Each possessed a good watch and seals, and carried a well-filled purse. One only had a pocket-book, containing many papers, chiefly relating to money matters and betting transactions; but only one letter, which, however, proved of immense importance in throwing light on the lives and characters of the deceased burglars, and in telling the story of the attempted robbery. The letter was directed to 'Mr John Bellamy,' at an address in Shoreditch, London, and was dated from Roxburn, the name of a large neighbouring farm, and bore the initials 'J. P.,' which, with the writing, were at once recognised at the

inquest as those of 'James Palmer,' the managing bailiff at Roxburn Farm, a clever and unscrupulous fellow, without any regard for truth or principle, well known in those parts, but a man whom nobody liked and everybody distrusted. This communication was in these few but significant words: 'The 23d will do best; coast clear, no fear, all straight.—J. P.'

This letter, with the tools and a full report of the whole case, was at once sent to Bow Street, London, and an investigation made by the 'Bow Street runners'—the detectives of those days—for there were then no regular 'police,' as we now understand the term. On searching the premises in Shoreditch, indicated in the letter, where John Bellamy lived, it was discovered that the supposed John Bellamy was no other than 'Jack Rolfe,' one of the most successful professional burglars of that day; and the authorities hesitated not to express their satisfaction that his career had been so cleverly cut short.

An immense quantity of stolen property, of almost every description, was found at Rolfe's lodgings in Shoreditch; and what was more important—as regards the present narrative at least—a correspondence extending over three or four years between Mr James Palmer of Roxburn Farm and the arch-burglar John Bellamy, alias Jack Rolfe himself, by which it appeared that this robbery had been planned and arranged by Palmer, who had supplied Rolfe with the fullest information as to Mr Leggett's plate and money, as well as a neatly drawn plan of the premises, which was found amongst the papers. Palmer had also arranged the date of the robbery for the 23d of April, as he had discovered that Mr Leggett and his two sons intended to sleep out that night. Nor was this all; for only a few weeks previously, the rascal had had the effrontery to invite Rolfe to pay him a visit at Roxburn, under colour of his being a personal friend, which invitation Rolfe had readily accepted; and one of the witnesses at the inquest well remembered his coming, and at once recognised him in one of the dead men—he of the centre-bit. Rolfe was described as a quick, pleasant, and rather gentlemanly man.

Not far from Mr Leggett's gate, a light cart and pony were found tethered early in the morning of the attempted robbery. The cart had been hired from a neighbouring market-town to convey the thieves to the scene of operations, and to bring them back with—as they fondly anticipated—a sackful of rich plunder. They had been staying a day or two at this inn as commercial travellers, calling themselves brothers, and giving the name of Sinton.

On the evidence afforded by the correspondence found in Shoreditch, Palmer was apprehended; and further investigation brought out the fact that the notorious Jack Rolfe was not only his friend, correspondent, and accomplice, but his own brother also, Rolfe being merely an 'alias' for his real name of Palmer. The two men were very much alike both in face and figure; and it came out in evidence that they belonged to a family of burglars and sharpers. One brother had been transported for life for robbery and violence; another was then in prison for fraud and theft; James had just been apprehended;

and John had been shot dead whilst plying his trade. James appeared to have been the only member who had held a respectable position—that of manager of Roxburn Farm, and he could not keep away from dishonest practices. It was also further discovered that Palmer had been an accomplice in two or three mysterious burglaries which had been perpetrated in the neighbourhood during the two or three previous years, in which the thieves had displayed an accurate knowledge—even to minute details—of the premises attacked, the habits of the inmates, and the drawers or closets where valuables were kept. All this was due to the planning and arranging of the brother James, who could at his leisure quietly take his measures on the spot; which were then carefully communicated to his brother John, who ultimately became the willing executant. Palmer was shortly after brought to trial, convicted, and sentenced to fourteen years' transportation.

The verdict of the coroner's jury was 'justifiable homicide;' for in those days of desperate and well-armed burglars, the shooting of one or two of these gentry, whilst in the act of plying their nefarious calling, was considered not only a clever but a meritorious action.

THE EVIDENCE OF THE SENSES.

THE senses are the witnesses which bring in evidence from the outer world, without which that world would for us have no existence at all; but the mind sits aloft on the judgment-seat and forms its conclusions from the evidence laid before it; and these conclusions are for the most part wonderfully correct; for, though the testimony of one sense alone might lead the mind to form an erroneous opinion, this can be rectified by discovering what one or more of the other senses have to say on the same subject. When, however—as sometimes happens under peculiar circumstances—the evidence of one sense only is available, the mind may very readily arrive at a false conclusion. As an instance of this may be cited what is often observed by surgeons in cases of hip-joint disease. The patient, usually a child, complains of severe pain in the knee, which, however, has not, so far as can be ascertained, been injured in any way. Very likely, the pain is severe enough to prevent sleep at night, so that there can be no doubt about its existence, and it may perhaps have been almost continuous for some time past. Now, in such a case the surgeon will have a shrewd suspicion of what is really amiss, and very often will at once proceed to examine the hip. This he will do, too, in spite of assurances on the part of the parents that the patient always complains of the knee and of that joint only. He does not doubt that the pain feels as if it was in the knee, but he strongly suspects, nevertheless, that the disease is in the hip; and this often proves to be the case. This is an instance of what is called 'referred sensation.' The nerve which conveys sensation from the knee also sends

a branch to the hip-joint, and it is this anatomical fact which explains the phenomenon. It might be expected that even if the pain was not felt solely in the hip, it would at least be always felt there as well as in the knee. This, however, though sometimes the case, is by no means always so. In this instance, the patient comes not unnaturally to the conclusion that where he feels the pain, there the cause of the pain must of necessity be situated. He would be quite ready to declare that there was nothing the matter with his hip, for he cannot see into the joint and discover the disease there. He has, in fact, to depend upon the evidence of one sense only, and the conclusion based upon the evidence of the single sensation of pain, is false.

Another instance in which the testimony of one sense alone may lead to a false conclusion as to the whereabouts of the cause of a pain is found in what often takes place after the amputation of a limb. Most people are aware that after part of a limb has been removed by the surgeon's knife, the patient may still feel as though his arm or leg, as the case may be, was entire, may feel much pain in the foot when the leg has been amputated far above the ankle. Here, in recovering from the effects of the anaesthetic, were it not for the additional evidence of his eyesight, the patient might well doubt whether his limb had been removed at all. The amusing story, in Marryat's *Jacob Faithful*, of the old sailor who, having two wooden legs, was accustomed at times to wrap them up in flannel on account of the rheumatic pains which he said he felt in them, is not so very extravagant after all. It is not, however, altogether correct, as it represents the man feeling those pains in his legs long after they had been amputated. As a matter of fact, the false impression passes off before very long. The explanation given by physiologists is as follows: The severed nerve in the stump is irritated and gives rise to pain; and inasmuch as irritation to this nerve-trunk has hitherto been always caused by irritation of its ultimate filaments distributed to the foot and leg, the mind continues for some time to believe that the sensation still proceeds from thence.

We may glance at another and very similar instance of referred sensations occurring also in surgical practice. Amongst the rarer operations of what is termed plastic, and, by Sir James Paget, 'decorative' surgery is that by which a new nose is formed by calling in the aid of the tissue of other parts of the body. This has been done by bringing a flap of skin cut from the forehead down over the nasal bones. The flap retains its connection with the deeper tissues at a point between the eyes by means of a small pedicle, and thus its blood-vessels and nerves are not all severed. This flap is not simply pulled down from the forehead—it is twisted at the pedicle, so that the raw surface lies on the bones of the nose. Now, for some time after this operation has been performed, any irritation in the nose is referred by the mind to that part of the forehead from which the flap of skin was taken; and therefore, if a fly crawls over the patient's nose, it appears to him to be creeping across his forehead. Before the operation, whenever the nerve-ends in the flap were irritated, it was caused by something touching

the forehead, and it is some time before the mind ceases to refer such irritation to that part of the face.

Leaving, now, the domain of surgery, we may notice two simple experiments mentioned by physiologists, which all can perform for themselves. They both prove that conclusions formed upon the evidence of the sense of touch alone may be quite incorrect. By crossing the second finger over the first, and then placing a marble between the tips of the fingers, we get a sensation that leads us to suppose that there must be two marbles instead of one only. This is because two points in the fingers are touched simultaneously, which in the ordinary position could only be touched at the same moment by two marbles. Judging, then, from the sense of touch alone, the mind infers that there are two round hard substances beneath the finger-tips; but the evidence of eyesight and the knowledge that we have placed but one marble in position, corrects the misapprehension. Again, if we take a pair of compasses the points of which are not sufficiently sharp to prick the skin, and separating the extremities rather more than an inch from one another, draw them across the cheek transversely from a little in front of one ear to the lips, we shall be tempted to think, from the evidence of touch alone, that the points are becoming more widely separated. By measuring the distance between the two points afterwards, we can assure ourselves that this has not been so; but whilst the compasses were being drawn along the cheek, and still more when they had reached the lips, the impression that the distance between the points increased was very strong. This delusion is said to depend upon the fact, that some parts of the cutaneous covering of the body are much more plentifully supplied with nerves than others. It is stated that the mind probably forms its idea of the distance between two points on the skin which are irritated in any way—as, for instance, by the points of a pair of compasses touching the surface—by the number of nerve-endings lying between those two points which remain unirritated. Thus, if there be fewer unirritated nerve-endings lying between the two points of the compasses when placed on the cheek, than there are when they are placed at the lips, the mind will infer that the distance between these points is smaller in the former position than in the latter.

THE STATE'S NEGLECT OF DENTISTRY.

The machinery of the State is so vast that it may well be imperfect here and there. It frequently falls to the lot of individuals to point out how the tide of progress has left details in a condition of inefficiency. We note a recent instance of this. In August last, at the annual meeting of the British Dental Association, Mr George Cunningham, one of its members, drew attention to the backwardness of the practice of dentistry in the various departments of the State. The substance of his case amounted to this: In the army and navy, unskilled practitioners wielded uncouth and inefficient instruments in following antiquated and unscientific methods; while the police force and the em-

ployees of the India and Post offices by no means derived the full advantages of this department of medical science. Mr Cunningham was bold enough to include the inmates of prisons among those whose interests were neglected; and of course the principle of the humane treatment of criminals is already conceded in the appointment of jail chaplains and surgeons. We need not enter here into the voluminous details with which Mr Cunningham substantiated his case. The broad conclusions he would seem to draw are these: that the medical practitioner employed by the State should possess a more thorough knowledge of dentistry; that, where necessary, the services of the completely trained and qualified dentist should be secured; and that full resort should be had to the remedial resources of dental science. Seeing the suffering caused by diseases of the teeth, and the subtle and intimate connection existing between dental and other maladies, we trust Mr Cunningham's paper may receive the consideration it would seem to deserve.

THE BOARD OF TRADE JOURNAL.

Persons wishing to keep up their information on subjects connected with trade and changes in foreign tariffs may do so by consulting the *Board of Trade Journal*, the first numbers of which have just been issued. An attempt is also made in this journal to give the public information as to trade movements abroad, from the communications of the different consuls and colonial governors. Some of the periodical statistical returns of the Board of Trade will also be included from time to time. Such a journal deserves the support of all merchants and manufacturers at all interested in our foreign trade. Formerly, the commercial Reports from Her Majesty's representatives abroad did not see the light for months, or perhaps a year, after they were received; now, these have some chance of being really useful to persons interested in foreign trade and to the community at large.

LOVE'S SEASONS.

Love came to my heart with the earliest swallow,
The lark's blithe matins and breath of Spring;
With hyacinth-bell and with budding swallow,
And all the promise the year could bring.

Love dwelt in my heart while the Summer roses
Poured forth their incense on every hand;
And from wood and meadow and garden-closes
The sweet bird-voices made glad the land.

Love grew in my heart to its full fruition
When Autumn lavished her gifts untold,
And answered earth's myriad-voiced petition
With orchard-treasure and harvest-gold.

Love waned in my heart when the snows were shaken
From Winter's hand o'er the rose's bed;
And never again shall my soul awaken
At Hope's glad summons—for Love lies dead.

CHAMBERS'S JOURNAL

OF
POPULAR

LITERATURE, SCIENCE, AND ART

Fifth Series

ESTABLISHED BY WILLIAM AND ROBERT CHAMBERS, 1832

CONDUCTED BY R. CHAMBERS (SECUNDUS)

No. 150.—VOL. III. SATURDAY, NOVEMBER 13, 1886.

PRICE 1½d.

THE PORTABLE THEATRE.

A FEW wagon-loads of large and square wooden shutters; numerous poles of various lengths; a quantity of seat-planks and their supports; some scene-painted canvas wrapped around long rollers, some nailed and glued upon framework; a collection of ropes and pulleys; various 'stage properties'; two open coke-fire grates; an amount of dark and soiled drapery and cheap carpeting, and a mass of other things—meet these on the highway, and you may know that a portable theatre is shifting its quarters.

Soon after the wagons reach their destination, the work of building commences. The town chosen is no doubt a small one, with interests which may be manufacturing, mineral, or agricultural. The theatre had arranged for its stance before moving—some waste ground let at a nominal rent, or a field bordering the town. Then beardless men, dressed in stained and ragged cloth garments, start hacking up the ground, digging narrow holes wherein to erect uprights. While some erect the framework, others build at one end a gallery, at the other a stage; and so bit by bit. After an adornment of the interior by draping the walls with some material and giving a scant covering to the best seats, and a sawdust carpet to the whole concern, the labour of erection is about at an end, and the actor-builders are at liberty to cleanse—and shave themselves if they have time, and throw off their working clothes. If they perform the same night and are late, they will have little time for rest; and in the impersonator of Hamlet, who enters the stage at a quarter to eight to a flourish on brass and string, you may recognise the man who, forty-five minutes before, had been walking to his lodgings in a state of grime and weariness and with a stubbly chin. When he appears as the Prince, he is clean shaven, all hut the heavy monstache—for that is his pride, and is never sacrificed.

The portable theatre is generally 'run' by the proprietor, who is often also stage-manager and

leading man or comedian. The usual method of fixing the amount of payment to employees is by share. In this way every individual worker is a sort of partner, and so feels an interest in the welfare of the business; and if the receipts are large, he, and she, participate in the benefit. This method is favourable to the manager and proprietor too, even when business is not brisk, though he is never heard to admit as much. The mode of procedure is very simple, and may be worthy the attention of those who admire simplicity and promptitude in business. The sharing takes place nightly after performance, when the audience have dispersed and the curtain has been drawn up, and all the company are dressed for home and assembled on the stage. The proprietor sits at a table in the centre, the receipts in cash and a slip of paper before him. 'The "houso" is three pounds and fourpence,' the manager proceeds to explain; 'and from that is to be taken two shillings for ground-rent; that leaves two-eighteen-four. Now, twenty-five shares into that is two shillings and fourpence a share. It's very bad, especially for an opening night; but the show went well, so we may hope business 'll pick up, now they know what we are like. I hope it will, for all our sakes.' And then does the gentleman proceed to give to each member his one share, which on this night amounts to two shillings and fourpence; hut to the low comedian is given an extra half-share, according to agreement, for his services are very valuable to the firm, and he is expected to sing humorous songs during the interval between drama and farce.

Now, all this looks very fair on the face of it; but much may be learned by an analysis of the arrangement. The proprietor has given twelve and a half shares among twelve people, in which are included the small orchestra; the remainder he has put in his pocket. For his own services as leading man and stage-manager, and for his wife, who plays the feminine leading parts—when they are good—ha takes up four shares each night; for supplying the wardrobe!—which

is scanty and worn—he takes another share; he has another to recoup him for that night's outlay in stage properties; a half-share to pay for the coke the fires have burned; and lastly, he takes six shares as rent of the theatre, which is his property. So, of this twenty-five shares into which the receipts are nightly divided, the proprietor receives altogether twelve and a half. Much of this he would tell you is but the return of money previously laid out, and the melancholy sigh with which he accompanies the ceremony of division is meant to indicate the fact that he is losing money rapidly.

His wife, when not in the cast, or his offspring, or a decrepit father, are generally assigned to the post of money-taker at the theatre door. The company are supposed to have a check against them by appointing as their representatives those who collect the tickets. The person who receives the cash from the public as they enter is familiarly known to the fraternity by the name of 'first robber.'

Now, many who know the business have been heard to declare that the manager seldom loses—if ever—and generally gains, however slack business may be, and even while his fellow-actors are pinched for necessities. If it is asked, 'Why do the workers agree to such an arrangement?' it may be replied: 'The proprietor and manager is master in his own establishment; and those who won't conform to the rules of the theatre may go and make way for those who will.'

Altogether, portable actors, or, as many of the labouring classes prefer to call them, showfolk, make but a precarious living, and they have often many troubles, for which they receive little sympathy. At times they are heard speaking of how some years ago, during the fair at a certain town, they performed five times during the day, and individually amassed three pounds seven shillings for the day's work. But that was a rare occurrence, and they dwell with pleasure upon the memory of it. The usual share in ordinary times rises to five shillings nightly during good business, and perhaps as much as seven or eight on the Saturday, and very often it drops to the amount of but a few coppers. There is all the excitement of chance in this mode of remuneration, and that may offer an inducement to some speculative minds. If trade is bad, or the people are too poor or anti-theatrical, the strolling Thespian may find that his reward after work is something less than a shilling, and upon that he may have to feed and lodge himself until the next night brings a further supply.

Many who dwell in towns think that the portable theatre is now little more than a remnant of a bygone age, that the drama has cast off this itinerancy; and such thinkers would doubtless be surprised if they were shown a list of the play-houses that move about the country. They are certainly very numerous. These buildings seldom look well in the morning light; there is a dissipated look about them, as though they kept bad hours. This more particularly applies to the interior, to whose good appearance the glare of gas is very essential. When the actors assemble for rehearsal, which is generally at eleven o'clock, the drapery looks dull and tawdry, the woodwork seems rough, the sawdust over the earth-floor is dirty, and the scenes appear daubs. If there

be a little breeze astir, the canvas roofing overhead will flap with a sound like that of the sails of a ship at sea. The curtain and scene-cloths are rolled up, that the dust may not settle upon them.

When the players have gathered together, rehearsal commences. They seem a motley group. There is the proprietor and manager, a portly man, who is troubled with occasional rheumatism—which he calls gout; he wears a heavy moustache and a heavy gold Albert, and has much power of voice—which at times is decidedly throaty. There is the low comedian, who is small of stature, with an expansive face deeply lined; his legs are misshapen, and he walks with the gait of one who suffers the affliction of many corns and bunions. Naturally, his countenance has the most serious aspect of any one in the company; but usage has trained it otherwise; he would be a melancholy man were it not that he gained his living by provoking mirth, and has a reputation to keep up. In his youth, his soul aspired to tragedy, but his legs were against it. Within his quaint figure he holds more sentiment than many of his companions of more symmetrical mould, and he professes to be a diligent and critical reader. He values 'low comedy' now, because it has many advantages; it gains an extra half-share, makes him popular with the audience, and secures him the best benefit in cash to him.

The middle-aged man with the stiff carriage, and with the hair grown long and well oiled and curved, so that at the bottom it lies like a roll upon the neck, is the 'heavy man,' who claims the chief-villain parts; he glories in his deep tones and in his dark scowl. It seems he does not much admire the smooth-faced scoundrels of the drama; you cannot mistake the villainy he portrays; directly he enters the stage, you say, 'That is the villain of the piece.' And he is not without a speciality in his particular line of business; to use his own words—'He likes his scoundrel's "game"; no chicken-hearted repentance at the end of the last act.' His favourite final exit speech is thus: 'Ah! soh, you have counterplotted and balked me. But I-a haave played a bold and desper-rat game, and now I leave you with contempt-a! My curses light-a 'pon ye!' If, however, he is killed when villainy has done its allotted work, he makes the most of his death, and invariably dies with a terrific backward fall. He has been heard to complain that in his stage career he receives small encouragement; 'for,' argues he, 'after my heavy night's work, anybody may come on with a stuffed stick and knock me down, and they'll get all the applause.'

One of the company is a young man whose face has already lost its pristine freshness; he wears his hat with an inclination to the right, and looks to be a knowing, wayward, idle, and thriftless wanderer. A great amount of cheap beer enters into his idea of life. He drinks this liquor at any hour; and when counting his cash, calculates it not by pence, but by the half-pints it represents. He is a weed who benefits nobody, not even himself. Enough has been said about him.

The man who throughout his life has never ceased to do his best, honestly and cheerfully, and

has failed through no fault of his own, must be worthy of some respect. This has been the way of the old gentleman—he may be called that—whose age is more than any other of the company. In his work he is painstaking, even amid the inertistic surroundings of a portable theatre. He now possesses an extensive stage wardrobe, gathered for his own private use; it is the collection of years, and he is proud of it. You won't hear him speak so often of his own future now, but he is always chattering about what he thinks his daughter will do. She is a darling girl, he says, and will be the blessing of his old age.

His daughter matches well with the morning sunshine. A fresh, rosy-faced girl, with shining hair and laughing eyes, in great contrast to these yellow women and blue-chinned men. She always shows neatness and good taste. Her father has often told her that they are merely 'birds of passage' in this cheap playhouse, and she is anxiously anticipating their migration. If that indulgent old dad of hers isn't careful, she'll become a vain young woman.

As this girl is now, so was at one time that bleary-eyed, bedraggled woman, who seems to prefer sitting to standing and idling to working. She is untidy and careless, and walks out with her boots unbrushed. Her rising this morning is yet quite a recent affair; traces of sleep still cling to her eyes. Not many years ago, she was as fair and modest as the old man's daughter is now, and not a soul anticipated such a change. Who can answer that the other may not alter likewise?

The man who is hammering at some repair to the building is the degenerated female's husband, and candour must confess that he looks it. He has many of his wife's characteristics; the same dissipated face, impolite manner at times, and general attitude of discontent. But these parallel ways of theirs are not productive of concord; quite the contrary, for, as one of their acquaintance tersely observes, 'They quarrel like old boots,' a simile which must be more fantastic than correct.

Among the company is an old woman who only needs the sugar-loaf-shaped hat to resemble the familiar pictures of a witch. She is indigent to the portable theatre, was cradled in one, and knows little of any life beyond it. Her daughter is that scraggy, uncanny-looking young female, whose dominant passion at present is jealousy of the old man's daughter, whom she never ceases to malign.

The rehearsal here is not generally a long ceremony. A partial or complete repetition of the words, and a comparing of notes respecting the various entrances, exits, and general business of the play, and that is all. Then the healthy-minded people do their marketing, and go off for a short walk. The others continue to 'hang about.'

The audience that comes here likes its dramatic food strong—no parlour comedies and talky dramas, but plenty of incident, of action, passions, stirring speeches, combats, and a little coloured fire burned off the wings. The probability of the sequence of events as here dramatically represented, or the possibility of their occurrence at all, are not matters which trouble the mind of

either the actor or his audience. In the matter of denouements the author's published idea is quite regularly departed from in the portable theatre, and of greatest playwrights' masterpieces it is frequently said: 'Oh, we can bring the curtain down better than that.' So, directly vice is unmasked with a taste of punishment, the virtuous gather together—perhaps without explanation of why they were so near—and the hero spouts a short speech in a victorious spirit, and thus—finale.

At one travelling theatre where the manager followed the usual custom of announcing during each evening the succeeding night's programme, the drama in question had been billed. In the managerial speech occurred the following words: 'I have very great pleasure in announcing for next Thursday night the production, for the first time during our visit, of the favourite play, entitled *Maria Martin, or the Murder at the Red Barn*. I have further pleasure in stating that the version we play has never been performed in this town; and was written expressly for this company by a relative of the Martin family, and has been scoured by me at great expense.'

This information was received, with much satisfaction and applause; that it had had the desired effect was proved conclusively by a view of the Thursday night's house. And the gentleman faithfully kept his promise, for he played a version that had certainly never been performed in that town; he introduced into the drama as usually given, a part of a gypsy family of vengeful proclivities, and so got two sets of murders, and as both were constantly repeated in visions, it may be supposed the audience had a fair dose of dramatic crime for its money.

But there is many a good performance to be seen in a portable theatre; and extremely good, when the surroundings are considered. The writer remembers a very creditable performance of the play of *Hamlet*—given one dreadfully wild night in a portable that was not the best of its kind. The rain had penetrated the roof in many places before the performance began, and the wind had been all day threatening to blow off the tilt. With the combined damp and cold, it was a very undesirable task to don long hose and thin velvet shirts, and to wear them for three hours in such a draughty and rain-sodden place. But this discomfort was necessary there, as a slight mitigation of a state of poverty. Perhaps there was a want of repose in the acting that night, for it was advisable to dodge those places where the water found the roof weakest, and so descended as from a spout. The Ghost, who had a cold, coughed during his scenes in a most unspectral manner. In the 'play-scene' there was a crash, and it was feared the tilt was gone, and one of the couriers ran out to see what had given way. Two of the rope-fastenings were loose and flying about wildly. They were secured during the performance, but not without some trouble, each male actor throwing a coat over his shoulders, and giving a hand when the scene in progress did not require him. But as these were fastened, others broke, and it was altogether a night of trouble. Before the last act was reached, there was little to be gained by dodging; the rain

penetrated steadily all over, and would fall on heads and run down backs and disturb projecting noses, wherever their owners stood. Hamlet died on a damp couch that night, for the stage carpet was soaked and flooded, but he would be artistic and die lying full length. I can testify that the Horatio, who had to kneel and support the Prince's head, wished he would die quicker. But 'The rest is silence,' came at last; and Hamlet jumped up again, and then looked radiantly happy; for just as the curtain was descending, one of the audience stood and threw to the actor a rose. It was a pretty compliment, and the recipient deserved it.

When the audience had dispersed, the actors received their reward—fifteenpence each. They deserved it. But their labour was not yet ended for the day. The rain had abated, but the wind lashed with greater force and blew with louder voice. 'Nothing short of a miracle will save that roof to-night,' said somebody. So its safety had to be guarded; that is, the company were to attend in turns and keep watch, two or three at a time. One of the coke-fires in the auditorium was replenished, and round it the men sat, talking of absent acquaintances, recounting the peculiarities of some, and giving anecdotes; while above their heads the swaying of the canvas sounded loud, and the whid whirled in fury round the creaking shutters. And thus, as they drowsily sit, wishing for rest, we will leave them.

BY ORDER OF THE LEAGUE.

CHAPTER XIII.

For a time, Enid stood looking at the sufferer sadly, and wondering where the friends of the poor girl might be. Gradually, as the scene came back to her, she remembered the words of Lucrece, and turned to her. 'Lucrece, did I hear you say you knew this poor woman?'

'Indeed, yes, miss. Three years ago, in Paris, Linda and I were great friends—what you English call "chums." She was an actress at the "Varieties"—a clever player; but she could not rise. Jealousy and a bad husband prevented that. Poor Linda, she has all the talent!'

'Strange that you should know her; but still fortunate. Perhaps, through you, we may be able to discover where her friends are.'

'Poor child! she has no friends.—But hush! See! she has opened her eyes.'

The sufferer was looking wildly around. She tried to rise, but the pain and weakness were too great, and she sank back with a deep fluttering sigh. As she collected her senses—'Where am I?' she asked faintly. 'How did I come here?'

'Do not distress yourself,' Enid said softly. 'You are quite safe. You had an accident, and they brought you here.'

For a moment the girl closed her eyes. 'I remember now. I was knocked down by a cab. But I am better now. Let me get up. Where is my boy?' she continued—'what has become of my boy?'

'Do not trouble yourself about your child,' Enid said soothingly, marvelling that one apparently so young should be a mother. 'He shall

be well cared for. Tell us where he is, and he shall be brought to you.'

'You are so good—so good and beautiful! You will find a card in my jacket-pocket where to send for him. Tell me, bright angel of goodness, what is the name they know you by?'

'My name is Enid Charteris,' she replied, smiling a little at the theatrical touch, earnest though it was.—'I must not let you talk any longer. The doctor was very strict about that.'

At the mention of the name, the sick woman became strangely agitated, so much so that Enid was alarmed. 'Am I in Grosvenor Square? Are you the daughter of Sir Geoffrey Charteris?'

'Yes, yes. But you really must be quiet now.'

But instead of complying with this request, the stranger burst into a fit of hysterical crying, weeping and sobbing as if her heart would break. 'Miserable woman that I am!' she cried, 'what have I done? Oh, what have I done? O that I could have known before!'

Enid looked at Lucrece in alarm. The outbreak was so sudden, so unexpected, that for a moment they were too startled to speak.

'She is unlinged by the shock,' Enid whispered. 'Perhaps if you were to speak to her, it would have a good effect.'

'Yes, madam. But if I may be allowed to make a suggestion—I should say it was better if you left the room for a time. She sees some likeness to you, or fancies she does, to some one. She knows me; and if you will leave for a short time, I will try and soothe her.'

'I think you are right, Lucrece. I will come in again presently, when she has become quieter.'

Directly Enid quitted the apartment, Lucrece's whole manner changed from the subdued domestic to the eager sympathetic friend. She bent over the bed and looked down in the suffering woman's eyes. 'Linda! do you not know me? It is I, Lucrece!'

'You—and here? What is the meaning of this, and in the dress of a servant? Tell me,' she continued eagerly. 'You are not one of his friends in his pay, to help his vile schemes?'

'I do not know who he is. I am here for a good purpose—to protect my mistress from a great harm.'

'Ah, then, you are no friend of Le Gautier's.—Do you ever see him? Does he come here often? Do you know what he is after?'

Lucrece started. 'What do you know of Le Gautier?'

'What do I know of him? Everything that is bad, and bitter, and fiendish! But he will not succeed, if I have to sacrifice my life to aid the beautiful lady who has been so kind to me.'

'You are not the only one who would,' Lucrece quietly answered. 'Tell me what you know.'

'I did not know then how good and noble she is.—My head is queer and strange, Lucrece; I cannot tell you now. To-morrow, perhaps, if I am better, I will tell you everything. I am glad now that they brought me here.'

Meanwhile, Maxwell was pacing about the drawing-room, having entirely forgotten the unfortunate woman in his own perplexity. He had been there perhaps half an hour, when Enid entered. She was not too occupied to

notice the moody, thoughtful frown upon his face.

'What a sad thing for her, poor woman!' she said.—'How did it happen, Fred?'

'Poor woman!' Maxwell asked vaguely. 'How did what happen?'

'Why, Fred, what is the matter with you?' Enid exclaimed with vague alarm. 'How strange you look! Surely you have not forgotten the poor creature you brought here not more than half an hour ago?'

Maxwell collected himself by a violent effort. 'I had actually forgotten. I was thinking of something else.—Enid, dear, I am going away!'

'Going away! Any one would think, from the expression of your face and the tone of your voice, you were never going to return. Where are you going?'

There was a very considerable chance of his not returning, he felt, and he smiled at the grin idea. 'I am not going far—at least not very far, in this age of express trains and telegraphs. I wish I could take you with me, darling; for I am going to a place you have often longed to see—I am going to Rome.'

'To Rome? Is it not very sudden? You never told me before.'

'Well, it is rather sudden. I have not known it long. You see, I could not tell you a thing I was ignorant of myself.'

'I wish you were not going,' Enid said reflectively. 'I have a feeling that some evil will come of this. And yet I suppose you must go. Is it business of your own, Fred?'

Maxwell hesitated. He could not prevaricate with those clear truthful eyes looking up so earnestly to his own. The soul of honour himself, he could not forgive the want of it in others; but he temporised now. 'Well, not exactly my own,' he stammered, trying to make the best of a bad case, 'or I would not go. It is a secret, which I cannot tell even you; but I shall not be long away.'

'A secret which you cannot tell even me,' Enid repeated mechanically. 'Then it must be something you are very much ashamed of.'

'Indeed, it is not,' Maxwell began eagerly, hesitated, and stopped. After all, she was right. It was a secret, a terrible, shameful secret, against which all the malignities in him revolted. For a time he was silent, hanging down his head for very shame, as the whole force of his position came upon him. For the first time, he realised where his rashness had led him, and what he was about to lose.

Enid looked at him in amazement, strangely mixed with a terrible and nameless fear. 'Fred!' she cried at length, white and trembling, 'you are going away upon the mission of that awful League! You cannot deny it.—O Fred! Fred!'

He tried to soothe her as she lay sobbing in his arms, but to no avail. The most fervent promises and the most endearing words she heeded not, crying that he was going from her never to return; and her fears were strengthened when he mournfully but firmly declined to speak of his mission. Presently, when she grew a little calmer, she raised her wet cheeks to him and kissed him. She was pale now, but confident, and striving with all the artifices in

her power to persuade him from his undertaking; but tears and prayers, threats even, could not avail.

He shook his head sadly. 'I would that I could stay with you, Enid,' he said at length, holding her close in his arms; 'but this much I can tell you—that I dare not dis obey. It is as much as my life is worth.'

'And as much as your life is worth to go,' echoed the sobbing girl. 'What is life to me without you? And now this thing has come between us, parting us perhaps for ever!'

'I hope not,' Maxwell smiled cheerfully. 'I trust not, darling. My time away is very short; and doubtless I shall not be called upon again for a time—perhaps never.'

Enid dried her eyes bravely and tried to smile. 'Good-bye, Fred,' she said brokenly; 'and heaven grant that my fears are groundless! If anything happened to you, I believe I should die.'

'I shall come back, darling.—And now, good-bye, and God bless you.'

After he was gone, Enid threw herself down upon the lounge and wept.

Le Gautier's star was in the ascendant. His only dangerous rival would soon be hundreds of miles away on a hazardous mission, out of which, in all human probability, he could not come unscathed, even if he escaped with life; a prospective father-in-law wholly in his power; and a bride in press, upon whose fears he could work by describing graphically her father's danger, with the moral, that it would be her duty to her parent to wed his preserver, Le Gautier. This, in fine, was the pretty scheme the wily adventurer had sketched out in his busy brain, a scheme which at present looked like being brought to a successful issue.

Another source of congratulation to this inestimable young man was the progress he was making with the fair stranger, known to him as Marie St Jean. By the time a fortnight had passed, he had been in Ventnor Street more than once, and quite long enough to feel a passion stronger than he had ever experienced before. It was absolutely dangerous to him, he knew, to be with her so often; but like the moth and the candle, the attraction was so great that he found it impossible to keep away—not that he lost his head for a moment, though he well knew that Marie St Jean could turn him round her finger; but he had formed his plans even here. The first step was to betray the League—the scheme was not quite ripe yet, and the news of Maxwell's uncertainty—and then take Marie St Jean for a tour upon the continent. There would be plenty of time to return and marry Enid afterwards without any unnecessary bother; for he had already made up his mind that Miss St Jean was too proud to show her wrongs to the world.

On the Monday afternoon following Maxwell's departure, Le Gautier turned his steps in the direction of Grosvenor Square, feeling on good terms with himself and all mankind. His schemes were prospering hugely. It was clearly useless, he determined, now to hesitate any longer; the blow must be struck, and the sooner the better for all parties concerned. With this intention upmost in his mind, he trippingly

ascended the steps of Sir Geoffrey's house and knocked.

He found the baronet in the library, engaged as usual over some volume of deep spiritualistic research; the thing had become a passion with him now, and every spare moment was spent in this morbid amusement. He was getting thin and haggard over it, and Le Gautier thought he looked very old and careworn as he watched him now.

'You have come just in time,' he cried, placing a paper-knife in the book and turning eagerly to Le Gautier. 'I have a passage here that I am unable to understand. Listen to this.'

'I have something more important to speak of,' Le Gautier interrupted. 'I have something more pressing on hand than that attractive subject. Sir Geoffrey, next week I am summoned to Warsaw.'

The baronet began to feel anxious; he knew perfectly well what was coming, and, like all weak men, he dreaded anything like evil. The part that he had to play was a despicable one, and he feared his daughter's angry scorn. Like a recalcitrant debtor, he began to cry for time, the time that never comes. 'So you informed me last week,' he replied, twisting a paper-knife in his hands uneasily. 'I hope you will have a pleasant journey. How long do you expect to be detained there?'

'I cannot tell; it depends upon the amount of business to be done. I may be away six weeks; but, at the very least, I do not see how I can get back to England under the month.'

Sir Geoffrey's face lighted, in spite of his air of regret. Le Gautier noticed this; nothing escaped the ken of those keen black eyes.

'And when you return, we will complete our little arrangements,' Sir Geoffrey exclaimed cheerfully. 'No hurry, you know, no haste in such matters as these; and, referring to our previous conversation, we cannot be too careful in treading such uncertain ground. End!'

'Precisely,' Le Gautier interrupted. 'With all due deference to your opinion, there is need of action, which is a very different matter from that raw haste which your poet tells us is half-sister to delay. I must have something definite settled before I leave England.'

'Pon my honour, you know, you young men are very hasty,' the baronet fidgeted; 'there is no controlling you. In my time, things were quite different; men professed a certain deference to women, and did not take so much for granted as you do now.'

'Sir Geoffrey,' Le Gautier interrupted again, 'things change; men alter; but perfect love is the same for all time. I love your daughter, and would make her my wife.'

In spite of the baronet's feeble-mindedness, there was always something in the Frenchman's higher flights which jarred upon his nerves, a sense of insincerity, a certain hollow, grotesque mockery, which pained him. The last word struck upon him like some chords played out of tune. Still the spell was upon him; he had nought to do but obey.

'We perfectly understand that,' he replied, 'and therefore need say no more about it. You have my promise; indeed, how can it be otherwise with the memory of that awful manifestation

before me? And the word of a Charteris is always sufficient. But I do think, Le Gautier, that you are pushing this thing too far.'

'Let the depth of my love excuse my impetuosity,' and again the words struck harshly on the listener's ears. 'Surely the excuse is a good one. I am leaving England shortly; and before I go, I must—nay, I will have an answer to the question which affects my happiness so deeply. It is only fair, only just that I should know my fate.'

Sir Geoffrey speculated feebly what he was to do with a man like this. 'But have a little patience; let me prepare her for your proposal.'

'Which you will promise to do, and put off day after day, as a man does who has an unpleasant task to perform. No, Sir Geoffrey; I do not wish to conduct my wooing second-hand. There is no time like the present; my motto is "Now." I do not ask you to help me; but before I leave this house, it is my intention to speak to your daughter.'

In sheer desperation, not unmixed with a little irritation, Sir Geoffrey rang the bell, and desired the servant to conduct Le Gautier up-stairs. The thing must come sooner or later, he knew; and so long as he was not asked personally to interfere, he did not so much mind, though he was not unconscious of sordid twinges of conscience as his arbitrary visitor disappeared.

RACING ROGUERIES.

To a man not infected with the disease, Turf-mania must appear the blindest of all infatuations. The gambler who trusts to the fall of the cards, arguing that in the natural fitness of things he is certain to be a winner some day, and spends all his time in calculating the doctrine of chances, is a rational person to the gull who, knowing what a mass of roguery leavens the Turf, will yet stake money, honour, and life upon its eventualities. Yet this is done every day, not only by greenhorns, but by men who are quite alive to the mysterious workings of the betting ring, who are fully aware that the ability of the horse or the jockey is the last factor to be taken into consideration; who can amuse you for hours with stories of the swindles practised by owners, trainers, jockeys, 'rings,' and who yet go on putting their money on the horse 'that must win'—and never wins—in utter defiance of their foregathered knowledge. The racing 'prophet' who is behind the scenes, who makes 'the turf' the business of his life, not only fools the readers of the newspaper to which he sells his vaticinations, but himself as well, and often returns from a race as penniless as the silly ones who pin their faith upon his oracular utterances. Even the bookmaker has his 'fancies,' upon which he stakes, and loses, the money that fools have put into his purse, with a blind confidence that is almost incredible.

A certain horse has acquitted himself well in his trial gallops; there is not one in the race can beat him; and if he were allowed to do his best, would undoubtedly be the winner. But, as Touchstone says, 'There is much virtue in an if.' In the first place, the owner may not intend him to win, and may have actually

made arrangements for laying against his own horse. Or if the owner be 'straight,' the jockey may have been bribed to check the horse's speed as he nears the winning-post by some one whose interest it is that the horse shall not win. All these may work together, or each may have different interests in the event. And even should the animal be meant in all honesty to win, a stable lad for a five-pound note may secretly physic the horse, and good-bye the chances of the favourite on the morrow. Or some lurking ruffian in the pay of another owner or bookmaker may contrive to gain admission into the stable unknown to the animal's guardians, and 'noble' for himself. But even after every form of knavery has been set aside, there are contingencies that still render the risks of backing horses enormous. The jockey may spend the night before the race in dissipation, and mount with swimming head and nerveless hands; or in his cups he may betray some secret of the stable that will give the advantage to a rival; or the horse himself may become sick, or be out of form, or stumble, or be thrown out by a cur running across the course, or other accidents easy of occurrence; and yet, knowing all this, men will naively risk large sums upon the supposition that no such *contretemps* will happen.

A few anecdotes, however, of undeniable authenticity will better illustrate the tricks of the Turf than would pages of reflections and generalisations.

About half a century ago, at Newmarket, several horses who stood high in the betting, at different times suddenly went off sick just before the race for which they were entered; some died, others recovered, but all were disabled for the time being, and favourites that a few hours previously outstripped every rival, would come straggling yards behind the field. Every one knew they had been 'nobbled,' but for a long time the perpetrator remained undiscovered; at last, however, a notorious scoundrel, one Dan Dawson, was caught red-handed poisoning the troughs. During the trial, it came out that he had made a regular trade of these nefarious practices, and it was more than suspected that not a few of the biggest men on the Turf were his employers. But although he was condemned to death, whether from the hope that some among his influential patrons would intercede for a reprieve, or from that hatred which certain men of his class have against 'peaching,' he never betrayed them, and remained silent to the end. The most minute precautions are taken to guard the racehorse from such dangers, yet the cunning or daring of his enemies frequently proves more than a match for the care of his owners.

In 1842, Lanercost was regarded as the certain victor for the Ascot Cup. While he was being conveyed to the course in a van, the grooms in charge stopped at an inn between Leatherhead and Sunninghill to refresh, leaving one to keep watch. Just after they had gone into the house, two sailors came out of it. 'Hillo,' cried one, 'here's Lanercost; let's have a peep at him;' and he sprang up on the side of the van, while his companion at the same time diverted the attention of the man on guard. A moment afterwards, the first jumped down

again, and then the two disappeared into a copse: it was all done so quickly that the groom had no time to interpose; and before he could summon his mates, the men were out of sight. When the race came on, instead of achieving the anticipated victory, poor Lanercost came in last. In the course of the ensuing month, he entirely changed colour, and was never fit to run again. There is no doubt that the pretended sailor had contrived to administer some powerful drug to the animal during the few seconds he hung over his box.

Somewhere about the same time, a horse named Marcus was the favourite for the St Leger. The day before the race, while he and some other horses were standing at the Doncaster Arms, an ill-looking fellow entered the kitchen of that tavern and seated himself beside a boiler from which the stable lads were every now and then drawing water for their charges. There was no one in the kitchen save a maid-servant, whom the stranger sent out to bring him a pot of beer. When she returned, the girl was going to fill her tea-kettle from the boiler, but the fellow stopped her by saying: 'I wouldn't take my tea-water from there if I was you, it looks so yellow and greasy.'

'All right; I'll get it outside,' she answered. When she came back the second time, the man had gone.

The next morning two horses were found dead in their stalls; while Marcus, who was just able to run, came in last, and also died during the day. Upon the bodies being opened, arsenic was found in their stomachs. The girl then remembered the incident of the loafer, who had no doubt poisoned the water in the copper; and bad she been as stubborn as most of her kind, several human victims would have been added to the equine list. By the defeat of Marcus, the owner of a horse named Chorister won seven thousand pounds.

Sometimes the defeat of the favourite is brought about by less bold but more subtle means; and occasionally the tables are turned in a very unexpected manner, as in the following instance. For the Doncaster of 1824, Jerry—a horse belonging to a well-known sporting man named Gascoigne—was the favourite. A little before the event came off, however, George Payne, a noted Turfite, got 'the tip' from John Gully, the prizefighter, that Jerry would not win; and the day before the race, these two worthies, doubtless well knowing *why*, laid six thousand against him. Gascoigne could not understand how it was that the more he backed his horse, which was in magnificent condition, the less it advanced in favour. He felt sure there was a screw loose somewhere, but he could not tell in what direction to look for it. Two nights before the race, as he was taking a walk in the outskirts of Doncaster, he paused at a turnpike gate, and just at that moment a postchaise stopped to pay toll. By the light of the lamp which the toll-keeper held in his hand, Gascoigne observed the jockey who was to ride Jerry next day seated within, almost helplessly drunk, between two of the most notorious blacklegs of the time. In a moment he saw it all. Hurrying away, lest he should be recognised, he went back to his hotel, and set about concocting measures to counteract

the plot that he perceived had been formed against him. Without making known his discovery to any one, he secured the services of another jockey, bound the man down to silence; and at the last moment, just as the traitor was going to mount, his substitute slipped into the saddle, and won the race, to the discomfiture and well-merited loss of the conspirators, who had betted all they possessed upon the event.

Men called 'Touts' are employed by book-makers and others to watch racehorses at exercise and report upon their condition; these spies are abhorred by trainers and owners, and have to pursue their espionage under many difficulties, sometimes lying in a dry or a damp ditch, or a hole covered over with brambles, or on the roof of a stable, to be ready to witness the morning gallop. When detected, they do not often escape under a horsewhipping or a ducking. On one bitterly cold night, a fellow had crawled upon the roof of a stall to listen if the favourite had a cough. Aware of his presence, though pretending to be ignorant of it, the trainer ordered the stable boys to throw up pails of water upon the spot where he was ensconced until the very clothes froze upon the poor wretch's back; but he had the consolation of hearing the horse stabled beneath cough several times, and next morning the odds were heavy against the favourite. Unfortunately for the rogues, however, the favourite on the previous night had been moved into another stable, and a horse with a cough had been substituted, to deceive the tout, with the result that those who ventured their money on his information, lost.

A much cleverer ruse was the following. An owner named Wilson was about to try a two-year-old colt. 'We shall be watched, and his white right fore-leg will be sure to be noticed,' remarked the trainer.—'Leave that to me,' said Mr Wilson. Next morning, he was at the stable at daybreak, and with some black paint soon changed the colour of the leg; while a brush dipped in white transferred the distinguishing mark to a far inferior horse, which showed but poorly beside the other. The tout on the watch naturally took one for the other, and reported accordingly. The next day, a certain nobleman gave fifteen hundred for the falsified animal, which was worth about four.

We have purposely omitted the more celebrated Turf swindles, such as the 'Running Rein' fraud, and others that made a sensation in their day, confining ourselves to the less known affairs, which were not found out until reparation to the victims was impossible, our principal desire being to make clear to 'the outsiders' the enormous odds against which they stake their money.

Those who are not behind 'the scenes may suppose that the bookmakers (pencilers) and the 'knowing ones' generally, enjoy a perfect immunity from the perils and dangers, pitfalls and temptations, of horseracing; but that is not the case. Not untravellingly they walk blindly into the trap they set for others; the biter is frequently bitten; and many an ingenious fraud has been put upon the 'pencilers' by outside betting-men, as the two following stories will show. For obvious reasons, all data are suppressed, but the truth of the anecdotes can be vouched for.

One day a City man, who was given to betting, and whom we shall call A, received a visit from a friend addicted to the same weakness, who shall be designated B. Locking the room door and sinking his voice to a whisper, B announced that he had made a wonderful discovery by which betting could be reduced to a system of all prizes and no blanks, and consequently a fortune very quickly realised. 'Now is your chance,' he said, 'if you like to join me. I shall give no explanation of the method; come and see for yourself.'

An appointment was made for the next morning, the date of the X races, at the Z (betting) Club.

'Have you anything on this race?' was the first inquiry made by B as A came into the room.

The answer was in the negative.

'Now, listen to me,' said B, drawing him into a corner, for the place, as usual at such times, was crowded with betting-men: 'the final list for the twelve o'clock race will be telegraphed here in a few minutes.' (The Z, it need scarcely be said, had its private tape.) 'Lay all the money you like, at any odds, upon the horse I shall select, and I will guarantee that it shall be the winner. But mind, you must not lose a second after I have given you the hint. Go to the nearest bookmaker in the room and make your bet on the instant.'

A minute or two afterwards, the electric bell gave the signal, and there was a general rush to the machine. B was one of the first to scan the list: there were five runners. He passed his finger down the names until he paused almost imperceptibly upon Y, and looked at his companion, who, although it was the very last horse he would have thought of backing, boldly called out: 'I'll take the odds against Y.'

Y being a rank outsider, a bookmaker laid the odds on the instant. One minute afterwards came the announcement that Y was the winner.

After they left the club together, B unfolded the mystery. 'When the list of runners was telegraphed,' he said, 'the race was already won.'

'But how could that be?' asked A. 'The race was run at twelve, and the time on the telegram was three minutes to twelve.'

'The time was falsified,' was the reply. 'The message was not wired until past the hour, nor until the winner was declared.'

'And how could you fix upon the right one?' demanded A.

'There was the minutest dash on the tape against the name of the winner, only noticeable by one in the secret. You see, the clerks are in the pay of an Association. There are three or four other clubs beside this where we get the telegrams in the same manner, so that we vary our times. Here, for instance, we put upon the twelve o'clock race; at another, upon the one; at a third, upon the two, and so on.'

We may add that the fraud was ultimately discovered, and the clerks who worked it severely punished.

The next trick we shall relate could not be practised now, in consequence of an alteration in the Turf customs. It was worked in this

fashion by two confederates. Let us suppose it to be the Lewes race. One of the two goes down to Lowes on the previous day, and by the last post sends a letter addressed in pencil and unsealed to his brother-rogue in London. Inside the envelope is a note addressed to a bookmaker, simply containing the words, 'Please back for so much.—Yours truly, Jones'—a blank being left for the horse's name. This missive arrives in town by the morning post, and the instant the race is run the name of the winner is telegraphed to rogue number two, who then inserts the name of the horse, rubs out his own name and address from the envelope, writes that of the bookmaker instead, and seals it up. Everything is now perfect in appearance: there are the Lewes postmark of the previous night, the London of the morning, and the seal untempered with. We need scarcely say that the handwriting appears to be the same, and, according to the rules of racing at that time, if a letter be delayed in transmission through the post, the bookmaker is still made answerable for its contents.

And now, how is it to be got into his hands without exciting suspicion? There are several ways of doing this: sometimes he may be at the club, and then the letter is dropped into the letter-box; but the favourite dodge is to dress up a man as a postman, with bag and a bundle of letters in his hand, who will deliver it at the victim's office; or the confederate will watch for the real postman, walk behind him, drop the letter on the pavement, and then call out to the carrier: 'Hillo, you've dropped one of your letters.'

The man will pick it up, and, being almost certain to have others addressed to the same person, innocently play the rogue's game. As to the bookmaker, all he can do is to write a letter of complaint to St Martin's-le-Grand and pay the money.

You cannot touch pitch without being defiled, or play with edged tools without being cut, says the old proverb; and you cannot associate with rogues and play the rogue without occasionally being swindled yourself.

MISS MASTERMAN'S DISCOVERY.

IN TWO CHAPTERS.—CHAP. II.

SINCE she left the rectory, she had had two letters from Lady O'Leary, a passage in the second having made a powerful impression upon her: 'Since your departure, my dear Phoebe, I have had leisure for much reflection on the subject of your frightful discovery; and after considerable cogitation, I have arrived at the conclusion that it is certainly your bounden duty to acquaint the bishop with the conduct of Mr Draycott, and to do so at once before you return to Sunnydale. I should advise you to write and inclose that abandoned widow's note. I fancy that we are not the only ones who are beginning to see through this sanctimonious villain of a rector. I observed last Sunday that several of the congregation, amongst them Lady Conyers and General Scott and his family, who always stay

for a chat with the Draycotts after service, left the church as quickly as possible, as if to avoid speaking to any of the family. Mrs Penrose was not at church; no doubt she had her reasons for staying away, though I heard from Miss Jones that it was given out that it was a bad headache that kept her at home.'

From Lady O'Leary's statement, it was not clear if Mrs Penrose's headache had been publicly announced in church or not; and the worthy lady had also omitted to mention that it was entirely owing to her own hints and innuendoes, industriously dropped here and there, accompanied by significant looks of unutterable meaning, that the mind of the parish was being considerably exercised with grove doubts as to Mr Draycott's moral character. The letter went on to say that invitations had been issued for a large evening party at the rectory on the following Thursday. Lady O'Leary strongly urged Miss Masterman so to time her return as to be present at it, adding: 'I intend to go, as I feel it my duty to neglect no opportunity of collecting evidence which may serve to deliver our hearths and homes from this contaminating presence of the shameless Draycott!'

On reading this, Miss Masterman considered that there was no further proof wanting of the enormity of the rector's guilt. Another suspicious circumstance was, that she had received no invitation, and in three days the party would take place. She therefore felt convinced that the rector, dreading lest her keen eye should detect more than would be noticed by the shallow members of his own family, had made some excuse to prevent Mrs Draycott from bidding her to the festivity; consequently, resolving to hesitate no longer, she sat down and indited the following letter:

To the Right Rev. the Lord Bishop of —.

MY LORD—I venture, as a temporary resident in the parish of Sunnydale, to call to your lordship's notice some heinous irregularities in the conduct of the Rev. Stephen Draycott, rector of that parish. I should indeed blush to record the details of his guilt in any words of mine; but the inclosed note, addressed to him by a person who calls herself 'Mrs Penrose,' will, I think, speak for itself. The individual whom I allude to is, I have every reason to fear, an astute adventurer; and should your Lordship think it worth while to make further inquiries respecting her, I have no doubt that sufficient evidence will speedily be found to substantiate my statements in every respect.—I have the honour to be, My Lord, Your Lordship's most obedient humble servant,

(MISS) PHOEBE MASTERMAN.

Miss Masterman next wrote a letter to the unconscious Mrs Draycott, fixing the following Friday for her return, at the same time fully intending to make some excuse for arriving

unexpectedly on Thursday afternoon instead, so as to be in time for the party in the evening. She then sent a few lines to Lady O'Leary acquainting her with all she had done; and after seeing her letters posted, she congratulated herself on the courage and resolution with which she had carried out what she believed to be a duty to society.

On Thursday, Miss Masterman left Bradborough early in the morning, having so arranged her journey that she would arrive at Sunnydale about six, which, as she calculated, would give her time to unpack and dress for the evening. But, by an unfortunate chance, it happened that as the train by which she travelled during the first part of her journey was delayed, it would be quite impossible to be at the rectory much before eleven o'clock P.M. Even Miss Masterman felt that that would be too late an hour at which to arrive unexpectedly; so she made up her mind that her only course would be to go to the village inn for the night, her one consolation being, that Lady O'Leary would be sure to give her a full and particular account of all that occurred at the rectory.

The alteration in her arrangements was most annoying to Miss Masterman, who, like many other rich people, if she made a plan, expected, as a matter of course, that it should be rigidly adhered to. During four hours which she had to wait at a junction, she sat and brooded over her grievances, waxing more and more grim as she did so. To add to her irritation, the rain began to come down in torrents; and the cold and draughty station was made additionally comfortable by the damp air which came in through every door and window, and penetrated to every bone in Miss Masterman's body.

At length, however, the dreary journey came to an end; and on reaching her destination, she took a fly, and ordered the man to drive her to the only decent inn that Sunnydale could boast. By this time it was past eleven o'clock. The rain had ceased, and the moon was shining brightly, throwing streams of silvery light on all around, and bringing every object into unusual prominence. In order to reach the inn, it was necessary to pass Fern Lodge, the pretty cottage residence of Mrs Penrose. Fancying she heard voices, Miss Masterman leaned forward and looked out of the window. What was her horror and amazement to see Mr Draycott gallantly escorting Mrs Penrose to her door! There was no mistaking the rector's tall figure and dignified deportment. But the widow! Dressed in what appeared to be an elegant costume, her bare arms and neck, plainly visible through her black lace shawl, were gleaming with diamonds! But even this was not all! The bright moonlight falling on her upturned face as she smiled upon Mr Draycott, plainly revealed powder and rouge! Slowly the pair advanced towards the house, and as a turn in the road hid them from sight, Mr Draycott was bending over his companion, apparently engaged in earnest conversation.

Miss Masterman sank back in the fly in the greatest agitation. Her worst suspicions were

now confirmed! and by the time she arrived at the inn, she felt fairly exhausted with excitement. Miss Masterman at once requested to be shown to her room; and during the greater part of the night she lay awake, thinking over the startling discoveries she had made and their probable results. On one point she had quite made up her mind—that nothing would induce her to remain any longer under the same roof with the rector. So she arranged with the hostess of the *Sunnydale Arms* that she would stay there for a week—to await events. At an early hour she called upon Lady O'Leary; but, to her great disappointment, she found that lady confined to her room with such a severe attack of gout, that she had been unable to be present at the rectory on the previous evening. The invalid listened with greedy interest to Miss Masterman's revelations, and for the moment she forgot the pain she was enduring in the delight of hearing about Mrs Penrose's rouge, and especially the diamonds, which were 'confirmation strong,' if any were needed, of the words in the fatal letter. On her side, Lady O'Leary had little to tell Miss Masterman, except that two days ago she had seen Magdalen Draycott, who told her that they only expected about half the number they had asked to the party, as so many had refused. The girl had also said that her mother was a good deal worried about it; from which Lady O'Leary concluded that things were coming to a crisis, and that people were beginning to see the unprincipled Draycott in his true colours. The interview between the two ladies was terminated by a paroxysm of agony which seized upon the invalid, and completely incapacitated her for further conversation.

Miss Masterman returned to the inn for lunch, and then prepared for her momentous visit to the rectory; for she had resolved to board the lion in his den, and to denounce him in the presence of his family as a hypocrite. On arriving at the rectory, she was told by the servant who appeared in answer to her imperious knock, that the rector was at that time engaged with the churchwardens and others on parish business, and could not be interrupted.

'My business will not admit of delay,' replied Miss Masterman. 'I must insist upon seeing the rector at once.' Then, as the servant endeavoured to expostulate—'No words!' continued the spinster; 'conduct me to him at once.'

The servant then led the way, though with evident reluctance, and throwing open the drawing-room door, announced Miss Masterman.

Bristling with conscious virtue, her tall form drawn up to its fullest height, she intrepidly advanced, seeming to breathe out threatenings and laughter in her progress, and her whole appearance formidable to the last degree.

The dining-room was full of people, who were seated round the long table, at the head of which presided the rector. The two churchwardens were seated near him. The rest of the party included Mrs Draycott, Lady Conyers, General Scott, and many of the leading residents of Sunnydale, who had met to discuss some necessary alterations in the hours of the church services. At sight of Miss Masterman, a dead silence fell upon the assembly. Nothing daunted, she advanced to Mrs Draycott, and held out her

hand; but, to her surprise, she was repulsed. She was then addressed by the rector, who, rising from his chair, said in dignified accents: 'If you wish to speak to me, Miss Masterman, I will come to you presently in the study. At present, I am engaged, as you see, with my friends.'

'I can perfectly understand your motives in wishing to speak to me without witnesses, Mr Draycott,' replied she; 'but you shall not escape so easily. What I have to say shall be said here, in the hearing of your wife, and of the friends whom you have so grossly deceived.'

'I spoke for your own sake, madam, not mine,' said the rector, as he turned pale with anger. 'But since you insist upon it, pray, let my friends hear what excuse you have to offer for this uncalled-for intrusion.'

'I wish to acquaint them with your real character,' answered Miss Masterman firmly. 'You know that you are an unprincipled man and a profligate.'

At these audacious words, all the company rose to their feet, with the exception of Mr Sheldon, the rector's churchwarden, a young and rising solicitor, who—his professional instincts instantly on the alert—scented legal proceedings, and began quickly and silently to take notes of all that passed. The other churchwarden, Mr Blare, a little puffy, red-faced man, with a temper that was the terror of all the naughty boys in the parish, after vainly trying to express his wrath articulately, sank back into his chair again gasping and snorting, till his face assumed an apoplectic hue that was truly alarming. The rest of the assembly loudly expressed their indignation at Miss Masterman's extraordinary allegations; when above the din rang out the rector's clear and penetrating voice. 'My friends,' he cried, 'will you be seated, and listen to me!' Then, as they obeyed in silence, he turned to the furious woman before him, and continued: 'May I ask, Miss Masterman, by what right you abstracted a letter from my study, and then took the unwarrantable liberty of sending it to the bishop?'

'I wished to open the bishop's eyes to your real character,' replied Miss Masterman. 'I read that letter by the merest accident, and I felt that it was only right that others should be undeceived as well as myself.'

'And are you aware,' demanded Mr Draycott sternly, 'that you have rendered yourself liable to an action for libel?'

'Certainly not,' answered Miss Masterman, 'for I have only spoken the truth. It is of no use to try and bully, Mr Draycott; your character has now been discovered.'

At this crisis, Miss Masterman was interrupted by an angry snort from Mr Blare, who, after making another futile attempt to express himself coherently, subsided into a violent fit of coughing, after which, he contented himself with giving vent to a short jeering laugh whenever Miss Masterman spoke, in a manner that irritated that lady almost beyond endurance.

'Perhaps, before you indulge in any more strong language, you will be good enough to listen to a few words of explanation,' proceeded the rector. 'The letter which you purloined from my study referred merely to some theatricals. My wife

had written a little play in which Mrs Penrose was to take part; the play was to be acted last night at a party in this house, which had been purposely kept a secret from you on account of your known dislike of all theatrical entertainments. The articles alluded to in Mrs Penrose's letter to me were required by her for the part she was to play. Had you mentioned the matter to me or to any member of my family, you would have heard the truth, and spared yourself and us much unnecessary pain.'

'Then,' gasped Miss Masterman, 'when I saw you and Mrs Penrose at eleven o'clock last night'—

'I was escorting' her home, after her kindness in helping us,' replied Mr Draycott. Then, as his voice trembled with suppressed anger, he continued: 'I have been this morning, thanks to your impertinent interference, subjected to a severe cross-examination by my bishop; and though I trust he is now convinced of the falsehood of your allegations, I have been put in a most painful position. Owing to you and Lady O'Leary—who has not scrupled to spread scandalous reports about me in my own parish—I have been cut by some of my most valued friends; and if I refrain from prosecuting you both for libel, it is only on condition that you offer a full and ample apology for your most wicked and uncalled-for assertions.'

As Miss Masterman heard these words, she felt ready to sink through the ground, for she at once saw the folly and wickedness of her conduct in its true light. All her assurance deserted her, and she feebly tried to falter out a few words of regret; but the rector sternly interrupted her. 'That is not sufficient, Miss Masterman,' said he. 'I must trouble you to write at once to the bishop, and also to send a paragraph to the local papers, to retract every word that you and Lady O'Leary have said against my character. Should you, or she, refuse to do me this justice, I shall immediately commence proceedings against you both!'

Here the solicitor interposed with: 'I am in a position to warn Miss Masterman that should Mr Draycott determine to institute proceedings for libel, the damages in this case might be excessive.'

Baffled, confounded, and for the first time in her life completely cowed, Miss Masterman looked helplessly around her, and had the mortification of seeing Lady Conyers, General Scott, those rich and influential members of the congregation, whose friendship she had so sedulously cultivated, turn their backs upon her in utter contempt, as she passed down the room; even kind Mrs Draycott averted her eyes from her; and her equanimity was by no means restored when, on reaching the door, she found that it had been left partially open, and that the whole of the preceding conversation had been overheard by Master Bubert, who was now turning somewhat in the hall, as Miss Masterman more than suspected, in celebration of her own discomfiture.

It is scarcely necessary to add that Miss Masterman and her friend were only too thankful to accept the rector's terms, and so escape the just penalty of their conduct; and whenever, after this, Miss Masterman felt inclined to give

too free license to her tongue, the rising temptation was instantly subdued by the recollection of the mischief once wrought by that unruly member during her summer holiday in the parish of Sunnydale.

PHOTOGRAPHIC STAR-CHARTING.

It is now some years since photography was first called to the assistance of the astronomer, and the results which have been achieved show that it will play a still more important part in the future. A description of all its advantages would carry us far beyond the limits of the present article; but we mention four, as they are necessary to the understanding of the subject.

The power which the sensitive film possesses of recording the appearance of a bright object to whose light it has been exposed for only a minute fraction of a second, has enabled us to obtain pictures of the sun that are much more accurate than ordinary drawings. The camera, moreover, has the faculty of seeing a great deal in a very short space of time. If we confine our attention to a small area, a very few moments suffice to show us all that is to be seen by the naked eye; persistent looking for half an hour would only tire our eyes without enabling us to see anything at first invisible. It is different with the camera; the longer the light is permitted to fall on the plate, the more details do we find in the resulting picture. The fact that some rays are more effective (photographically) than others has enabled Dr Huggins to photograph, in full sunlight, that extremely faint solar appendage, the corona, which is visible to the eye only when the intense light of the sun is hidden as during a total eclipse.

The latest demand which has been made upon the astronomer's new assistant is no less than a great atlas of all the stars down to those of the fifteenth magnitude. The magnificent idea of photographing this immense number of stars—probably about twenty millions—is due to the officials of the Paris Observatory. The instrument which Messrs Paul and Prosper Henry have constructed for this research may be described roughly as two telescopes side by side and moving together. One of these, having a specially designed object-glass, carries the sensitive plate for the reception of the image. The arrangement is provided with a clockwork motion, in order that, during the time of exposure, the situation of each star's image may not alter; but as clockwork, however carefully made, is not infallible, an observer, looking through the second telescope, nips in the bud, so to speak, any tendency to aberration. Since the little spots that frequently occur on the photographic plates may be mistaken for stars, and so serve to swell future lists of 'variables,' each plate is exposed three times, and each star is therefore represented by three marks. The alteration in the position of the plate between each of the three exposures is so slight, that it requires a microscope to show that the dots are triple. With this

splendid apparatus, only one two-hundredth of a second is necessary for the recording of the position of first-magnitude stars. Those of the sixth magnitude, which can only be perceived with the naked eye on a very dark night, require only half a second. The faintest which can be seen through the telescope, those of about the fourteenth magnitude, take three minutes to make an impression. But although the human eye is not sensitive enough to go any farther than this, stars of the fifteenth and even the sixteenth magnitude can be made to appear on the plate, if the exposure be sufficiently prolonged. In the latter case, an hour and a half is necessary.

In one of Messrs Henry's charts, about five thousand stars were counted. The construction of such a chart by the ordinary method of measurement would have taken many months; now it only takes three hours. Thus the preparation of a set of maps such as Messrs Henry suggest would occupy less time than the charting of one-hundredth part of the number of stars by ordinary methods. It has been calculated that if the work be divided among twelve observatories, five hundred and ten photographs would be required from each; and making every allowance, ten years would probably see the completion of the most elaborate survey of the whole heavens ever undertaken. This may seem a long time; but we must remember that Argelander's great charts of the northern hemisphere, which contained only three hundred and twenty-four thousand stars, occupied seven years of observatory work alone!

The importance of obtaining a permanent record of the present positions of twenty million stars cannot be overestimated. We find that if old measurements, such as those of Ptolemy, Copernicus, Tycho Brahe, and others, are to be trusted, very great changes must have taken place in the heavens. But are they to be trusted? The differences between their observations and ours must in many cases be attributed to the roughness of their instruments; but some cannot be altogether explained thus. As, however, we do not know where actual change ends and faulty measurement begins, no very definite knowledge can be derived from the comparison. A photograph of some part of the heavens by Cassini—what an invaluable legacy it would have been! With such a survey as Messrs Henry propose, future astronomers will be able not only to be sure of the existence of changes, but also to measure their extent. But the astronomers of the future will not be the only gainers. During an hour, a planet moves quite an appreciable distance; it will therefore appear on the plate as a short line instead of a point. Thus, one of the first results will probably be a considerable accession to the numbers of the minor planets which circulate between Mars and Jupiter. Who knows that the transneptunian planet itself will not be found in this way? Besides this very obvious advantage, these charts will be of the greatest use in the study of the form and constitution of the stellar universe. It is only by the employment of such charts that we can arrive at a proper understanding of star arrangement. The methods of star-gauging which Sir William Herschel employed for this purpose failed to give any satisfactory account of the form of the Milky-way in

space. His first method was to point his large telescope in various directions successively, counting the number of stars visible in the field each time. He argued that if the stars were scattered with approximate uniformity throughout the galaxy, then the more he counted in a unit of area, the farther must it extend in that direction. On this assumption, he calculated that the depth of the Milky-way was eighty times the distance of the first-magnitude stars. Sir John Herschel, by precisely the same method, found the proportion to be seven hundred and fifty instead of eighty! This discrepancy alone gives some idea of the untrustworthiness of the method; and there are many other arguments against it, into which we have not space to enter.

Sir William's second method, although sometimes confounded with his first, was in reality quite different from it. Instead of counting the number of points of light seen with the same telescope in equal small areas in various parts of the Milky-way, he now attempted to estimate the depth by noting the telescopic power necessary to 'resolve' the nebulous places into crowds of separate stars. When we examine the galaxy with the naked eye, it appears to be simply a cloud of misty light. A small telescope, however, suffices to show that it is made up of stars; but in most parts the background still seems nebulous. A stronger telescope entirely clears up and resolves some of these nebulous portions, while other parts require a still stronger power, and so on. In this way, then, assuming that the more difficult a misty part of the heavens was to resolve, the farther off the stars composing that misty part were, he attempted to gauge the star depths. It now appears that when he thought he was penetrating space farther and farther with telescopes of gradually increasing power, he was in reality only resolving masses of (smaller) stars situated at about the same average distance as the larger bodies which had been already distinguished with a feebler power, and which he had therefore assumed to be nearer. As a well-known writer says: 'In each case where Herschel had assumed that he was penetrating farther and farther into space, he was only analysing more and more scrutinisingly a complex cloud of stars.' It is interesting to notice in this connection that one still sees Herschel's so-called split-grindstone theory (which was based on observations made by the first method) quoted and illustrated in many text-books, although he renounced it himself; and it is perfectly obvious to any one who has considered the question in the light of recent researches, that that theory is totally untenable.

The charting method gives a very different account of the constitution of the universe. Investigation in this direction has shown that the Milky-way, far from being an affair of great depth in proportion to its distance from us, is really what it seems, an immense irregular stream or belt composed of stars of all sizes. Much information has been extracted from Argelander's great charts; but the photographic charts, that will contain sixty or seventy times as many stars will be still more useful. If the idea is taken up as enthusiastically as it ought to be, and if our government, so niggardly in matters scientific, can be induced to follow the enlightened example

of the Emperor of Brazil, and provide our observers with proper instruments, there is no reason why this great atlas should not be an accomplished fact in a few years.

DAVID'S SON SOLOMON.

MR DAVID MOSES, who is now dead, was a jeweller and pawnbroker in Wyeh Street. He kept a very good show of jewelry in the front window of his establishment, and was never known to complain as to trade being unsatisfactory in the line of watches and precious stones and electro-plate. But Mr Moses made much more money by his pawnbroking than by his jeweller's shop, and still more by discounting bills at cent. per cent., than by either of the two businesses which he ostensibly followed. The bill-discounting, which was also accompanied by money-lending at stiff rates, was not done at the shop in Wyeh Street, but at an office in the neighbourhood of Lombard Street. The office was handsomely fitted up; the shop was rather second-hand in appearance, and filled with odds and ends which had never been redeemed from pawn. At the shop, Mr Moses rarely showed himself, for he had a valuable assistant in the shape of his deceased wife's sister, Miss Rachel Levi, who managed the pawnbroking and jewelry business with a regard to the main point that would have done credit to Shylock. The aptitude of this elderly Jewess left Mr Moses plenty of time to attend to the office in the neighbourhood of Lombard Street. He was not Mr David Moses there; that cognomen was painted in faded gilt letters above the Wyeh Street shop; but the office bore the name of 'Mr Alfred Morris,' which title seemed more in accordance with the character of the clients who came thither to borrow on the strength of their aristocratic names or connections, or to transact business connected with what is technically termed a 'bit of stiff.' Anybody who was anybody could always get a 'bit of stiff' from Mr Alfred Morris, provided he had no objection to pay a handsome rate of interest, and allow a fair margin for commission and charges and other little incidental expenses. Many of Mr Alfred Morris's clients knew his real name to be David Moses, and were aware of the Wyeh Street business, where, indeed, some of them had property lying in pledge. These, however, were old customers, and could be trusted; to all new ones and to the outside world, Moses was Mr Alfred Morris.

In appearance, the old man, was eminently Hebraic. He had a hooked nose, and very curly white hair; he spoke with a nasal accent, and called middle-aged men 'ma'-year.' As regards his business character, he was Shylockish. He wanted, and took good care to get, his pound of flesh, and an ounce or two over. He never blushed to lend you fifty pounds on a hundred pounds acceptance, or seemed to think it out of the way to deduct five pounds from the fifty for

'present expenses.' By his orders, the poor folk who came on Monday morning to put the Sunday wearing apparel into pawn till the following Saturday evening were screwed down to the fraction of a penny; while the timid vendor of second-hand jewelry or old gold was browbeaten to such an extent that he or she gradually came to the opinion that the goods were really worth no more than Miss Rachel Levi represented, and thankfully accepted the price which that estimable lady offered. It was Mr Moses' idea of business to be hard and sharp and to look out for number one.

There was, however, in the heart of Moses one very soft spot. It may seem incredible that he who sucked the very lifeblood from young and foolish actions of noble houses, or made no difficulty in getting hold of the substance of widows and orphans, should have been capable of affection. But Moses was capable of a great deal of affection, and this soft spot was all affection. It is a pity that we should have to say the affection was lavished on a worthless object; for Mr Solomon Moses, the only son and child of the old money-lender, and whom the old man loved as well and as dotingly as his riches, was a thoroughly bad young scoundrel. When David Moses was sixty, his son Solomon was twenty-three, and schooled in vice and debauchery.

The senior Moses' plans with regard to his boy were from the boy's very birth of the high and mighty kind. He intended first of all that the little Solomon should be a 'shentleman,' and have nothing to do with the shop in Wych Street. He should, on attaining his majority, be provided with unlimited pocket-money and told to 'go the pace.' Perhaps, thought Mr David Moses, some of the young swells whom he was always having dealings with would take Solomon up and initiate him into the mysteries of society. When, therefore, Solomon came to his twenty-first birthday, Mr Moses took expensive chambers for him in the West, placed a handsome sum with a banker at his son's credit, and told the young man that nothing would please him better than to know that his boy was living the life of a gentleman. You may be quite certain that Mr Solomon Moses was not slow to take advantage of his father's kindness. His ideas of a gentlemanly life were somewhat hazy, but they were decided enough upon the subject of clothes of the fastest and loudest cut and style, of billiards and unlimited card-games, of gambling and prize-fights, and of disreputable companions. He 'went the pace' splendidly; and Mr David Moses liked it, and thought his son a fine, lively young gentleman indeed.

When Solomon was twenty-three, he was as villainous a scamp as one could find in all London. The money he wasted would have supported a dozen ordinary families in comfort, yet he had twice persuaded his father to double his allowance. The old man was beginning to fear his son, and readily acceded to any request for money which Solomon made. Once or twice a shadow of suspicion had crossed his mind that Solomon was not the brilliant result he had hoped for. The younger Mr Moses, for instance, had not gained the entrée to society which it had been his father's aim he should secure. He had not made the acquaintance of the aristocracy, nor

did he seem likely to contract a brilliant marriage with a peer's daughter; and the only comfort old David had was the thought that these things took time.

One hot day in the summer of 1883, Solomon called a hansom, and was driven to his father's office near Lombard Street. He found 'Mr Alfred Morris' in and free, and forthwith made known his wishes, which ran in the direction of the sum of one thousand pounds. Old David stared.

'But, ma tear poy, I haven't so much moneys about me!' he objected. 'And besides, ma tear, I gave you your money for the quarter on'y last week. What may you require the moneys for?'

'Betting heavy, and lost,' said young Solomon briefly.

'Petting! O my poy, that's pad—that's pad! And lost too—that's worse! I tolt you not to pet unless you was certain of winning, Solomon, ma tear. Oh, to think that you are making the peaceful moneys fly away like that!' And then Mr David Moses plucked up spirit, and gave his worthy son a real good lecture on the evil of wasting money. Solomon listened impatiently, and again repeated his request for a thousand pounds. And he got it—as he knew he would. Then he went away and called another cab, and prepared to be driven back to his elegant rooms. As he was piloted up the Strand, it occurred to him that he would call in at Wych Street and see Aunt Rachel; so he stopped his cab, and went into the jeweller's shop, and was welcomed by the old Jewess in the back-parlour. The worthy lady was polishing up some diamonds, and Solomon's eyes wandered over the precious baubles covetously.

'Anything very valuable there, auntie?' he asked presently.

'No, Solomon dear; nothing—nothing. The big diamond there is pretty well. It is worth two thousand pounds.'

'Two thousand, eh?' said young Mr Moses. 'Very fair that, ain't it?'

'Well, your father lent one thousand on it—or rather, I did.'

'Never redeemed?'

'No.'

Solomon took up the glittering stone and looked it carefully over. It was set in a massive ring, very plainly made, and with two or three distinctive marks inside the hoop. 'And you're asking two thousand for this, auntie?'

'Yes, my dear, that's the price. I shall put him in the window in a week or so.'

Solomon went home soon after that. His first proceeding, when he got out of his father's shop, was to write down in his pocket-book a very accurate description of the big diamond and its ring. A very clever and equally rascally plan was forming itself in his brain. By the time he reached Trafalgar Square, his plan was complete.

During the next week, more than one person stopped to gaze at the great diamond flashing in Moses' shop-window. Its price was not upon it; but it was evident from its size that it was of tremendous value. Passers-by speculated on the probable amount, and wondered when the thing would find a purchaser. About eleven o'clock

on the first day of its exposure, a middle-aged gentleman, sauntering leisurely up Wych Street from Booksellers' Row, stopped in front of Moses' shop, and looked for some minutes at the contents of the window. He was a good-looking man, well dressed in a quiet, unostentatious fashion; evidently a man of substance and position. He was turning away, when his eye fell on the great diamond. He looked at it a second, and then opened the shop-door and walked in. A red-headed boy of distinct Hebraic extraction was yawning behind the counter. 'What is the price of the large diamond in your window?' asked the solid-looking gentleman.

The red-headed youth didn't know, but would find out. He disappeared for a moment, and came back followed by Miss Rachel, who looked narrowly at the man who dared to ask the price of so large a stone. The gentleman howled courteously to Miss Rachel, and repeated his question.

'Two thousand pounds,' replied Miss Rachel.

'Ah! A large price. May I see it?'

Miss Rachel acquiesced, and took the diamond ring from its case in the window. The stranger looked it carefully over, examined every mark with a sharp eye, and finally returned it to the old Jewess.

'I will purchase that ring, madam,' he said. 'Be good enough to put it aside for me until to-morrow morning, when I will call and pay for it. I have been in search of such a stone for some time.'

Miss Rachel Levi was delighted. So, she was sure, would Mr David Moses be. She carefully locked up the ring in a big safe, and the stranger went his way with many bows on either side.

Precisely at eleven o'clock the following morning the customer called. He was accompanied by a dapper little man, whom Miss Rachel recognised as one of Mr Attenborough's principal assistants.

'Good-morning, madam,' said the stranger. 'Here I am, you see, and here is the price of the ring—two Bank of England notes of one thousand pounds each. I think that is correct?'

Yes, that was correct; and Miss Rachel unlocked the safe and handed the ring over to the customer, who had laid his two one-thousand-pound notes on the counter before her. She placed the notes in the safe, looking them over with an experienced eye, to see that they were all right as regarded genuineness. The stranger received his ring, and turned to the man accompanying him.

'I brought this gentleman with me,' he said to Miss Rachel, 'just to tell me his opinion of the stone.—Very fine one, is it not, Mr Jones?' He passed the ring to the man as he spoke, and began to talk to Miss Rachel about the weather.

The man named Jones looked with attentive eye at the glittering thing in his hand. He examined the gold setting and seemed satisfied, and then looked at the enormous stone. Suddenly he uttered an exclamation which made Miss Rachel and the customer look round sharply. Mr Jones took a little peculiar-looking glass from his pocket and gazed at the diamond suspiciously. He said 'Ah!' very emphatically, and threw the ring on the counter.

'How much did you give, sir?' he asked of

the customer, whose attention was now thoroughly aroused.

'Two thousand pounds.'

'Humph! Worth next to nothing. The gold's very good; the diamond's first-class paste!'

Miss Rachel uttered a faint scream as the customer turned to her. 'What explanation can you give of this, madam?' he asked.

The poor woman was dumb-stricken. She knew not what to say.

'Where did you get the ring, Miss Levi?' asked Mr Jones. 'Perhaps you've been imposed upon.'

'It was pledged with my brother David,' said Miss Rachel. 'O dear me, gentlemen, I can't think how it is! It must be an imposition.'

'Well, at any rate, I can't be imposed upon,' said the stranger. 'So I'll thank you for my notes, madam; and there is your paste ring.—Dear me, what an escape I've had! I'm much obliged to you, Mr Jones, for your penetration.'

'Oh,' said Mr Jones, 'that's nothing! What puzzles me is that Moses, who is very sharp, should have been swindled, as he must have been. And then Miss Levi here is a regular authority on stones.'

By this time poor Rachel had handed over the notes, and was regarding the fake ring with a very disconsolate face. She was thinking what David would have to say on his return home.

The stranger pressed something in the way of remuneration on Mr Jones and went away.

Jones stayed a minute or two longer and talked the matter over with Miss Rachel. It was his idea that old Moses had had a duplicate made of the big diamond for some purpose of his own, and that he had substituted the shadow for the substance. He suggested this to Miss Rachel, who was thereby a little comforted.

But Mr Jones' aspersion was wrong, as Miss Rachel quickly found on her brother's home-coming. She told him the story immediately he appeared, and the old man went nearly mad. He yelled for the ring to be brought him. Once in his hands, he literally shrieked with horror. 'It isn't the tiamont at all!' he cried. 'Mine was not paste, as this is. It's some conjuring trick, woman!' And he fell to moaning and sobbing as if his heart would break. But the first fit of rage passed off, Mr David Moses took a practical step. He called on Mr Jones, and the two went away together to Scotland Yard; there Jones described the strange would-be purchaser. The hard-featured 'chief' who listened to them smiled.

'That anything like him?' he asked, taking up an album and pointing to a portrait.

'The very man!' cried Mr Jones.

'Ah!' said the chief.—'Well, now, Mr Jones, be particular on one point. Did you keep your eye on the ring from Miss Levi's taking it from her safe till its coming into your hands?'

'No,' said Jones; 'I didn't. Miss Levi put the notes in the safe, and I was watching her for a second before the man passed me the ring.'

'Common trick,' said the chief.—'Changed it for a fac-simile.'

'But,' objected Jones, 'how could he make the fac-simile? The ring had only been in the window one day.—Had it, Mr Moses?'

'Only one day, ma' tear—only one little day,' sighed the old Jew. 'O tear, O tear me!'

The chief set his lips very hard at this. 'Are the marks—hall-marks and so on, just the same?' he asked.

'Yes,' said Moses, 'and the gold too. It's only the stone.'

In the end, they went away, and the chief promised to do his best. He knew the stranger, who was a returned convict and a clever trickster. The mystery was the fac-simile of the ring. It implied previous acquaintance of a very intimate type. In about a week Mr Moses received news: the real ring had been pawned in Manchester for five hundred pounds, and was now in possession of the Scotland Yard authorities. The latter had, they said, got a 'clue to the persons implicated; but they would say nothing more. When Moses was wanted, they would let him have word.

A week or two passed on, and one morning Mr David Moses received an urgent message asking him to go to Scotland Yard. The thieves, or whatever you would call them, were found. He called on Mr Jones, and set out with an exultant heart up the Strand.

'Well,' said the chief, 'we've got 'em both. There are two of them. One is the man whose photo I showed you; the other is a young fellow who won't give any name. He pawned the ring under the name of Morris.'

Moses thought that rather a coincidence; but he let the thought slip out of his mind, and smiled pleasantly when two policemen brought in the well-dressed gentleman who so tricked poor old Rachel. The *ci-devant* convict winked in a friendly fashion at Jones.

'Did it well, eh?' he said. 'No good disguising it, I suppose? Reckon I'll get a good dose for this.'

'You're right there, my friend,' said the chief. '—Take him away, sergeant, and bring the young man in.'

In a minute or two the men returned, leading in a young, londly dressed man, who hung his head on his breast. Old Moses turned from examining a pair of handcuffs hanging on the wall, and discovered the thief of his cherished diamond to be—his son Solomon! The old man saw it all in a moment. His white face and chattering teeth showed the chief that something was wrong. The old Jew strove vainly to speak for a second or two; then he turned to the chief and stretched out his hands imploringly.

'O Mr Inspector,' he said, 'it's a mistake—it's a terrible mistake, ma tear Mr Inspector! Don't say no more about it, and I'll—I'll give you the tiamont—yes, O yes! Why, this is ma tear son Solomon!—O Solomon, my poy, how could you do it?'

'Your son, eh?' said the astonished chief. 'Well, I'm sorry for you, old man; but the law must take its course.'

'Oh, don't say that,' screamed Moses—'don't sir, don't! I'll give you the stone, and a thousand pounds besides! Let him go, sir.'

'No; I haven't the power.—Take him away, men.' And they marched Mr Solomon off, while poor old David alternately wept and implored and raved, and beseeched the chief to have mercy on his 'tear poy.'

That night, they found poor David Moses, alias

Mr Alfred Morris, dead in his little sanctum in Wyeh Street. The doctor said he had died of a sudden shock to the nervous system. We are of opinion that his son Solomon had given him a shock which broke his poor old heart.

A NEW ART-GUILD.

An admirable proposal has lately been made at Liverpool for the formation of an 'Art-workers' Guild,' with the view to the diffusion of sound principles of decoration, and to the encouragement of workmen and others desiring to undertake decorative work of all kinds. The general object would appear to be to find good art-workmen, and to bring them into communication with those who require their work, and also to form a collection of good examples of decorative work of various kinds. Perhaps one of the best results of this sort of effort will be to bring forward the actual worker himself—the real artist, in fact—and thus get rid of the middle-man or art-tradesman who hires the genuine artist to do the work, and then stamps it with his (the tradesman's) own name, as though the work were actually his own, whilst, in fact, he is merely the employer of highly trained and perhaps highly talented art-labour—a system at once as unfair as it is unjust. It has been said that the ugly patterns in calico-printing seem to sell as readily as the pretty ones; and one of the objects of the proposed Guild is to try to alter this—to endeavour to produce a better taste. But teaching a prejudiced and often ignorant public to improve itself on subtle questions and nice points of art-excellence is at best a difficult if not a hopeless task; and if the Guild raises the artist-worker to a better position and gives him direct employment, it will certainly be conferring a benefit on a worthy class of men, never yet properly recognised.

A RETROSPECT.

I waited long;
My love was strong
For Cary.

'In spring,' she said,
The darling maid,
'We'll marry.'

The winter passed;
Spring came at last
With showers.
But what of them,
When after came
The flowers!

Our wedding-day,
A grand array—
Bells ringing!
Blue sky above,
Hearts full of love,
Flowers springing.

My blushing bride
And I beside
The altar:

She looked so nice,
Although her voice
Did falter.

Our honeymoon
Ran all too soon
Its measure:
We roamed at will
By vale and hill
With pleasure.

And years have flown;
We're wiser grown,
And older;
But aye the same
Love's kindly flame,
No colder.

As down we glide,
Still aids by side,
Life's river,
Each opening spring
New joys will bring
For ever.

NOTHING NEW.

ANTIQUARIES are always delighted to remind us that there is nothing new under the sun. When we boast of the great European art of printing, they bring in the Chinese as evidence against us. Certain it is, however, that the Romans used movable types to mark their pottery and bread, and even to indorse their scroll-books. But if this is to be called printing, then the Accadians, and their successors the Assyrians, did the like on a grand scale many centuries before. To the last-named people, moreover, must be ascribed, so far as we at present know, the invention of a magnifying lens of rock-crystal, a thing so well made, that Sir David Brewster pronounced it a true optical instrument. It was found amid the ruins of Nimroud by Layard.

It is curious to see also how great natural laws have been dimly apprehended centuries before they were rendered demonstrable. The law of gravitation was undoubtedly discerned by Sir Isaac Newton; but it is remarkable that in Cary's translation of Dante's *Inferno* an idea very like it occurs, namely:

Thou wast on the other side, so long as I
Descended; when I turned, thou did'st o'erpass
That point, to which from every part is dragged
All heavy substance.

Of this passage, Monti remarks that if it had met the eye of Newton, it might better have awakened his thought to conceive the system of attraction than the accidental fall of an apple.

For fifty or sixty years before any real light was thrown upon the nature of gravitation, Pedro Mexia of Seville had a clear and correct idea of its action. Thus, in his *Silva de Varia Leccion* (published in 1542, and which in various translations was in great demand until the middle of the seventeenth century), the following appears: 'The sky is above in all parts of the earth, and the centre of the earth is below, towards which all heavy things naturally tend from whatever side of the earth; so that if God had made a hole, which by a true diameter passing through the

whole earth, from the point where we are, as far as the other opposite and contrary to this, on the other side of the earth, passed through the centre of it: then if one dropped a plummet, as masons do, know that it would not pass to the other side of the earth, but would stop and place itself in the centre of it; and if from the other side one let fall another, they would meet together in the very centre, and there they would stop. It is quite true that the force might well cause the plummet to pass somewhat beyond, because its movement, so long as it was going towards the centre, would naturally be accelerated, passing somewhat beyond, but in the end it would return to its place.'

Of this old Spanish work, an English translation was made by T. Fortescue, and printed in London in 1676, entitled *The Forest, or Collection of Histories, no less profitable than pleasant and necessary*. Another appeared in 1613 with sundry essays by other authors, entitled *The Treasure of Ancient and Modern Times*. Considering that London publishing was on a small scale two and three centuries ago, it is difficult to believe that Newton missed seeing these works, even if he had not heard of the original. At anyrate, he must in all probability have read what Shakespeare, borrowing probably from the same source, puts into the mouth of Cressida:

But the strong base and building of my love
Is as the very centre of the earth,
Drawing all things to it.

Troilus and Cressida, act iv. scene 2.

Some anticipations of telegraphy are also very interesting. Galileo, in his *Dialogues on the Two Systems of the World*, that is, the Ptolemaic and Copernican, and which he wrote in 1632, makes Sagredo say: 'You remind me of one who offered to sell me a secret art, by which, through the attraction of a certain magnet needle, it would be possible to converse across a space of two or three thousand miles. I said to him that I would willingly become the purchaser, provided only that I might first make a trial of the art, and that it would be sufficient for the purpose if I

were to place myself in one corner of the sofa and he in the other. He replied that in so short a distance the action would be scarcely discernible; so I dismissed the fellow, and said that it was not convenient for me just then to travel into Egypt or Muscovy for the purpose of trying the experiment; but that if he chose to go there himself, I would remain in Venice and attend to the rest.

It appears, however, that telegraphy took form as an idea two thousand years ago, for Addison, in one of his delightful essays in the *Spectator* (No. 241), tells us that 'Strada, in one of his Prolusions, gives an account of a chimerical correspondence between two friends by the help of a certain lodestone, which had such virtue in it, that if it touched two several needles, when one of the needles so touched began to move, the other, though at never so great a distance, moved at the same time, and in the same manner. He tells us that the two friends, being each of them possessed of one of these needles, made a kind of a dial-plate, inscribing it with the four-and-twenty letters, in the same manner as the hours of the day are marked upon the ordinary dial-plate. They then fixed one of the needles on each of these plates in such a manner that it could move round without impediment, so as to touch any of the four-and-twenty letters. Upon their separating from one another into distant countries, they agreed to withdraw themselves punctually into their closets at a certain hour of the day and to converse with one another by means of this their invention.'

In Homer's *Odyssey*, translated by Pope, the following curious description—originally detected by an ingenious mechanic—of the Phœnician ships of old, has been well observed by the late Dr Birkbeck to be no inaccurate description of steam-navigation:

So shalt thou instant reach the realm assigned
In wondrous ships, self-moved, instinct with mind.

Though clouds and darkness veil the encumbered sky,
Fearless, through darkness and through clouds they fly;
Though tempests rage—though rolls the swelling main,
The seas may roll, the tempests swell in vain.
E'en the stern god that o'er the waves presides,
Safe as they pass, and safe repress the tides,
With fury burns; whilst careless they convey
Promiscuous every guest to every bay.

It would almost appear from the above passage, which for ages was considered merely a bold flight of the imagination, that the ancients were not unacquainted with some method beyond that of the ordinary sail, of propelling vessels through water with safety and celerity.

Even that horror of naval warfare, the fish-torpedo, seems to have been once afloat in the mind of Ben Jonson, although there are good reasons for thinking he derived the idea itself from Drummmond the inventor, whom he visited at Hawthornden in 1619. In Jonson's play, *The Staple of News* (act iii. scene 1), we read:

Thomas. They write here one Cornelius' son
Hath made the Hollanders an invisible oel
To swim the Haven at Dunkirk, and sink all
The shipping there.

Pennyboy. But how is 't done?

Cymbal. I'll show you, sir.

It's an antozoa, runs under water

With a snug nose, and has a nimble tail

Made like an auger, with which tail she wriggles
Betwixt the coats of a ship, and sinks it straight,
Pennyboy. A most brave device
To murder their flat bottoms!

Some of the most beneficent and useful discoveries in medical science appear to have been anticipated years ago. For example, certain skulls of prehistoric man have afforded the clearest evidence that even at that remote period the art of *trepanning* must have been practised upon them. A skull found in the tomb of the Incas, near the city of Cuzco, exhibited distinct marks of having undergone a like operation. According to a reputed discovery by M. Stanislaus Julien, it appears that as far back as the third century of our era, the Chinese were in possession of an anæsthetic agent which they employed during surgical operations. A description of this was discovered by M. Julien in a work preserved in the Bibliothèque Nationale, called *Kou-kin-i-tong*, or a General Collection of Ancient and Modern Medicines, which appears to have been published in the sixteenth century. In a biographical notice of Hoa-tho, who flourished under the dynasty of Wei, between the years 220 and 230 of our era, it is stated that he gave the patient a preparation of *cannabis* (*Ma-yo*), who in a few moments became as insensible as one plunged in drunkenness or deprived of life; then, according to the case, he made incisions, amputations, &c. After a certain number of days, the patient found himself re-established, without having experienced the slightest pain during the operation. It appears from the biography of Han that this *cannabis* was prepared by boiling and distillation.

Of the Germ Theory of disease, it must also be said, it is no novelty. That noted physician, Athanasius Kircher, in his work on the plague—published at Rome in 1688—attributed the origin of epidemics to germs, or, as he termed them, animalcules. He argued that each kind of putrefaction gives rise to a special virus, which produces a definite species of malady.

Even sticking-plaster is not a modern surgical appliance. One of the highest living authorities in organic chemistry states that the ordinary lead-plaster now so commonly used was said to be discovered by the Roman physician Menecrates in the middle of the first century.

Some readers of this *Journal* will remember that while the British Association was in progress at Montreal (1884), a telegram was received from Mr Caldwell in Australia, notifying that he had found *monotremes oviparous with mesoblastic ovum*—that is, that the ornithorhynchus, the duck-bill or water mole, laid eggs. This piece of news greatly interested naturalists, since it was justly regarded as furnishing one more link in the chain of evidence tending to support the evolution hypothesis. However, in a work entitled *The Literary Pancreaticum*, by Robert and Thomas Swinburn Carr, published in London in 1832, a quotation in the form of a footnote appears on page 8, as follows: 'But this is New Holland, where it is summer with us when it is winter in Europe, and *vice versa*; where the barometer rises before bad weather, and falls before good; where the north is the hot wind, and the south the cold; where the humblest house is fitted up with cedar; where the fields are fenced with

mahogany, and myrtle-trees are burnt for firewood; where the swans are black and the eagles white; where the kangaroo, an animal between the squirrel and the deer, has five claws on its forepaws and three talons on its hind-legs, like a bird, and yet hops on its tail; where the mole lays eggs, and has a duck's bill; where there is a bird with a broom in its mouth instead of a tongue; where there is a fish, one half belonging to the genus *Raja*, and the other to that of *Squalus*; where the pears are made of wood, with the stalk at the broader end; and where the cherry grows with the stone on the outside."—(Field's *New South Wales*, page 461.)

In striking contrast to all the above-named instances of discovery, is that fact furnished by some Assyrian bas-reliefs—that is, that the lion, or at least the Asiatic species, has a claw in the tuft of his tail. This fact, which, strangely enough, was disputed in classic times, although forty years before the birth of Christ, Didymus of Alexandria discovered it, had been quite overlooked by modern naturalists. Soon after the finding of the sculpture, Mr Bennett, an English zoologist, verified the observation.

Homer's famous story of the battle between the frogs and the mice is doubtless a political satire. That the story was originally suggested by actual observation is not an unreasonable fancy. Homer may even have seen the mimic campaign for himself, for it is but a tradition that he was blind. In a recent number of *Nature*, a correspondent states that he saw a short time since several mice pursuing some frogs in a shed. The alacrity of the reptiles rendered the attacks of the mice futile for some time. 'Again and again the frogs escaped from the clutches of their foes, but only to be recaptured, severely shaken, and bitten.' They were at length 'overpowered by the mice, which devoured a part of them.'

The first scientific expedition on record is one in which Aristotle was sent by Alexander the Great (more than 300 B.C.) for the purpose of collecting subjects for a History of Animals. In this enterprise he met with both the paper and the pearly nautilus; for in the *Historia Animalium*, he says, after describing different forms of Cephalopods, which no doubt abounded in Asiatic seas: 'There are also two other kinds of polypes which are in shells, the one [that is, the paper nautilus] has a shell which is not naturally adherent to it; it feeds very frequently near the land, and being cast by the waves on the sand, the shell slips, and it dies; but the other [the pearly nautilus] is in a shell in which it exists after the manner of a snail, and outwardly extends its arms.'—(Scaliger's translation.) Nothing was added to this account during the dark ages that succeeded, nor even till some time after the revival of literature. No further information respecting the nautilus was obtained until the discovery of a living specimen early in the eighteenth century by Rumphius, a Dutch merchant and naturalist, resident at Amboyna. His drawing of the soft parts separated from the shell was greatly valued for more than a century before another specimen was found, although the shells were cast ashore in comparative abundance. This specimen was sent to Professor Owen, and formed the subject of an elaborate memoir by

him in 1832. It may be said to have been the first to confirm the history of this remarkable organism given more than two thousand years before.

Here, then, we have another instance of modern research simply verifying that which was an ancient discovery.

It is even said that the stereoscope, which is Professor Wheatstone's invention, was known to Enclid, and minutely described by Galen, the physician, sixteen centuries ago; moreover, it was still more completely defined in the works of Baptista Porta in the year 1593. As for photography, its discovery is by common consent referred to Daguerre, who announced it to the Academy of Sciences in 1839. This beautiful art has, however, been found clearly described by M. Jobard in his *Nouvelles Inventions aux Expositions Universelles*, 1857, taken from a translation from the German three hundred years ago.

An ancient gold coin recast is, after all, the same precious metal; even so, truths long lost are, when found, restamped by human thought and made current again for the world's good. How few are privileged, or have the genius, to enrich mankind with an original discovery!

BY ORDER OF THE LEAGUE.

CHAPTER XIV.

LE GAUTIER followed the footman into the drawing-room, where Enid was engaged with some visitors—three tall showy-looking girls, with an extremely vivacious mother. Le Gautier stood looking out of one of the windows, and noticed with satisfaction their intention of a speedy exit. For some moments the visitors remained chattering, and then, after a profusion of compliments, accompanied by much laughter, their voluminous skirts were heard switching down the broad staircase. It has often been a matter of speculation as to whether a man can be in love with two women at the same time; but without going into this delicate question, it is possible to imagine a man with a penchant for two women, though the experiment probably would be attended with great hazard and danger. Le Gautier forgot the dark-eyed Marie, as he gazed upon Enid's fairer charms.

'You have heard nothing of Maxwell?' he asked after a pause in the desultory conversation. 'A strange thing he does not write. Many men would imagine that such a thing is not altogether an accident; there are occasions when a little absence from the gaze of man is desirable, Miss Charteris.'

'Many men, as usual, would be wrong,' Enid answered coldly. 'You should not shield your want of charity by these generalities, Monsieur le Gautier, though perhaps you have derived benefit from these absences yourself, you seem to understand the subject so thoroughly.'

Enid was angry at his too insolence, and replied to his want of taste by a little plain language herself; and her random shaft went home.

'You are severe; but really, while sorry for Maxwell, there is something in it which is comforting to me. Can you not guess what I mean?'

Enid Charteris, though guileless and pure as woman can be, had not mixed with the great world for nothing. She had had suitors enough to know what a proposal was, and above all things she dreaded one from this man. Some instinct told her he would be a dangerous enemy. 'You speak in riddles,' she said calmly. 'I have not been educated to the language of diplomacy. Pray, explain yourself.'

'Then I must be more explicit. Maxwell's absence rids me of a dangerous rival. Now he is away, the path is all the smoother for me. Need I tell you, Miss Charteris—Enid—that I love you? Surely you must have known that for a long time past. While another was in the way, I sealed my lips; but I can restrain myself no longer now.'

'It would be affectation not to understand you,' Enid replied with a calmness that boded ill for Le Gautier's success. 'I am sorry to hear it. If you are wise, you will not put me to the pain of a refusal.'

'I will take no refusal,' Le Gautier burst out passionately; 'for I swear that if you are not mine, you shall wed no other man. Enid, you must, you shall be mine! You may look upon me coldly now, but the time will come when you shall love me well enough.'

'The time will come when I shall—love—you?' This bitter scorn in those words stung Le Gautier to madness, stirring up a desperate passion in his veins, now that the prize seemed like slipping from his grasp. He fell at her feet on his knees. 'Hear me!' he exclaimed passionately—'only listen to me, Enid. I have vowed that you are the only woman I have chosen—this only girl I could really love. Such love as mine must win a return some day; only try; only give me a little chance of hope.'

'If you are a man, you will rise from that absurd position. Who am I, that you should kneel to me? You must take my word for it; and if you have any consideration for my feelings, you will change the subject.'

'And this is your absolute and final decision?'

'Yes, it is my absolute and final decision.'

Le Gautier rose to his feet, pale but smiling, and there was a darkly evil look upon his white set face. When he spoke again his words were cold and incisive. 'Consider, before you willfully make an enemy of me.' He uttered the words with a low sibilation. 'I have made you an offer—the highest compliment I could pay, and you have scornfully rejected it. The next favour you ask from me you may seek for on your knees.'

'And to what purpose, sir, shall I ask a favour from you?'

'For your father,' Le Gautier answered quietly, though his tones were deep and earnest. 'You have guessed that Maxwell has gone away on a dangerous mission. Why should not Sir Geoffrey be chosen in his turn? And if so, who can save him? I, Hector le Gautier, and no other man.'

'And by whose evil counsel has my poor father been dragged into your infamous Brotherhood?—By yours alone! He would be a happy man now, if he had never known you.'—

'On the contrary,' Le Gautier interrupted, 'I tried to save him. He has joined on his own wish. You do not credit my words. Go and

ask him now if my words are not true, and that, if it is not his dearest wish that you should become my wife.'

'He might think so,' Enid answered haughtily; 'but he does not wish it in his heart. Monsieur le Gautier, if you are a gentleman, you will cease this discussion. The subject is painful to me.' She stood there, looking at him coldly and scornfully.

But her very iciness only served to increase the warmth of his passion. 'I cannot!' he exclaimed. 'I will not cease! For five years, ever since I first met you at Rome, I have never ceased to love you. Bid me do anything in reason; ask me any favour; but to forget you is impossible!'

'I am sorry for you,' Enid said gently, touched a little by the ring of genuine passion in his voice—'I am sorry; but it cannot be.' I do not break my pledges so lightly, even if I wished to do so.'

'Which you do not,' Le Gautier bitterly remarked. 'I do not care. I am desperate now. You despise and scorn me; but I will not be rejected thus. If you will not be my wife for my sake, you must for your father's and the honour of your house.' He topped abruptly, for standing in the room was Sir Geoffrey, his face pale, and his whole aspect downcast and degraded to a pitiable degree.

Enid turned to her father eagerly. 'Did you hear these words?' she asked. 'Can it be possible that you—that I—that the honour of our house is in any man's hands? Can it be your wish, father, that I—I—should form an alliance with Monsieur le Gautier? Speak, and show him how mistaken he can be!'

But Sir Geoffrey never spoke. His head sank lower upon his breast. For the first time, he realised the sacrifice he had imposed upon his daughter, and so he stood there, an English gentleman no longer, but a poor enfeebled, shamefaced old man.

A wild feeling of alarm took possession of Enid as she saw this thing. 'Why do you not speak?' she demanded. 'What cause have you to hesitate in indorsing my words?'

Still the baronet never spoke, never raised his head.

Enid ran swiftly to his side and threw one arm round his shoulder. She could feel the spasm that struck him as he encountered her touch. 'Father,' she asked in a dull even voice, 'does your silence mean that he is right?'

'Yes, my dear child; he is right. There is no alternative.'

There is a providence which helps us in such times, as these, a numbness of the senses that for a time deadens pain. Enid's voice was very calm as she turned to Le Gautier, standing there trying to disguise his triumph. 'I do not know what all this means,' she said. 'I do not understand whence you derive your power. I cannot think now. For his sake,' she continued, pointing to her father, 'I consent.'

Le Gautier sprang forward; but she repelled him with a glance.

'Listen to my conditions,' she continued. 'I have said I consent; but I warn you that if there is any loophole for escape from you, I shall take it. You are going away, you say. Nothing

must be done till your return, and then the contract shall be fulfilled. Now, go.'

When Lucrece entered the room a few moments later, she found her mistress lying unconscious upon the floor. Looking out of the window, she saw the slim figure of Le Gautier disappearing in the distance, and smiled. He was smiling, too, as he walked away. Nothing remained now but only the final interview with Marie, and to regain possession of the lost moldore. A few weeks at Warsaw, and then—

CHAPTER XV.

Maxwell had been gone a week now, and no tidings of him had reached England, save one letter to say he was in Rome. As Le Gautier turned away from Grosvenor Square, his heart one glow of triumph, he determined that, come what may, he would never see England again. When he returned from Warsaw, he calculated that, through Marie St Jean's assistance, all information concerning the League would be in the hands of the police, freeing him from any further bondage, and throwing all the odium and danger on her. Full of these schemes, he arrived at his lodgings. A telegram was lying on the table. He took it up mechanically, and tore it open. The contents were terse: 'Visci died this morning from heart disease.' Le Gautier was wild with rage. Here was a pretty combination, he thought. Nothing now to detain Maxwell in Rome. The victim had fallen by a higher hand than that of man, and Maxwell was free.

As a Head Centre of the Order, Le Gautier wielded much power, and even now he did not despair, with the command of nearly all the desperadoes in Rome at his command. He had only to get Maxwell arrested in Rome on some false charge and carried to the mountains; and there—after a little delay and a packed meeting of the League—shoot a desperate man such as Le Gautier, especially with such a prize in their grasp, do not long hesitate over such a trilling matter as a human life, and he trusted to his own good luck and native audacity to pull him through.

It was getting dark the same night as he despatched a telegram to Rome, and then turned in the direction of Fitzroy Square. He was as eager now to see Isodore as he had been to encounter Enid in the afternoon, and looked forward not only to a pleasant evening but a remunerative one.

She did not keep him long waiting in the drawing-room ere she sailed in all smiles and welcome. She was looking radiantly beautiful to-night; there was a deeper flush on her face, and a glitter in her glorious eyes not usually seen there—signs of a loving welcome, Le Gautier imagined in his egotistical way. There was, besides, a warmth in her manner and a gladness in the pressure of her hand which inspired him, and sent an electric thrill coursing through his veins.

'You are looking more transcendently lovely than usual, Marie!' he exclaimed with a fervour unusual even to him. 'Every time I see you, there is some additional charm in you to note.'

'It depends upon whether the observing eye

is a prejudiced one,' she replied with a caressing smile, which brought him at once to her side. 'You say that now, Hector. How long will you continue to think so?'

'As long as I have power to think at all—as long as memory serves me. I shall remember you to the last day of my life.'

'I believe you will,' Isodore smiled bewilderingly. 'And yet, strange as it may seem, the time will perhaps come when you will wish you had never seen my face.'

'You are more than usually enigmatical to-night, Marie. You are a puzzle to me. I do not even know who you are. Tell me something about yourself, and why you are living in this solitude here.'

'No; not to-night; but, as I have often promised you, I will tell you some time. I will tell you who I am before you go away; and then, when your curiosity is satisfied, you will leave me.'

'Never!' Le Gautier exclaimed passionately. 'Leave you!—the only woman I ever saw that I could really love. Leave you, Marie! How can you entertain the bare idea?'

He would have approached her nearer, but she waved him gently but firmly aside. The distance she kept him fanned his passion all the more. 'Tell me something about yourself,' she said. 'That is a topic which never fails to interest me. How about the League, this Maxwell's journey? Has he accomplished his mission yet?'

'He is not likely to, now. Visci is dead!—Gracious powers, Marie! what ails you? Are you ill?'

Isodore uttered a sharp exclamation, and then reeled forward in her chair. Her face was white and drawn, her lips trembled. Gradually her bosom ceased to heave so painfully, and she turned to Le Gautier with a white wan smile, though he could see the fan still trembling in her hands. 'It is nothing,' she said with an effort. 'I am subject to these attacks of the heart, and any news of sudden death always affects me so.—Do not look distressed; it is past now.'

'There is nothing in the name to cause you any distress?' Le Gautier asked suspiciously.

'I have heard the name before, if that is what you mean. Tell me all you know of this Carlo Visci.'

'I did not say his name was Carlo,' Le Gautier observed, somewhat sharply. 'I can tell you nothing more. When I reached home this afternoon, I had a telegram to say he was dead.'

'And this Maxwell, what of him? I suppose he will return home now?'

'He has been somewhat dilatory in obeying orders. No; he will not return. He will be detained at Rome for the present.'

'Tell me why you hate this Englishman so.'

Le Gautier started. 'How do you know I hate him?' he asked. 'I have never said so.'

'Not in so many words—but in gesture and look, when you speak of him, your actions are eloquent, my friend. He has crossed your path. Ah, well, I like a good hater. Maxwell will suffer yet.'

'Yes,' Le Gautier exclaimed involuntarily, 'he will.'

Isodore rose and walked to the piano, where she sat for a moment striking the chords idly. 'When do you go to Warsaw?' she asked.

'I have six days remaining to me.—Marie, the time has come when we must no longer delay. The pear is ripe now; all my plans are matured. I have only to hold up my hand and the League will vanish.'

All this time, Isodore played on softly, musingly, the music serving like the accompaniment of a song to force the speaker's voice. As he stood there, and she answered him, she never ceased to play the soft chords.

'Then you have everything prepared?'

'Yes, everything is ready.' He drew a low seat to her side, and seated himself there. 'All the names are made out, the whole plot prepared.'

'And you propose to hand them over to me. It is a great compliment; and I suppose I must take them. I would run greater risks than this for your sake and—my own.'

She took one hand from the ivory keys and held it out to him. Drawing a pocket from his pocket, he gave it to her. She thrust it in her bosom, and ran her fingers over the keys again.

'All is there, I suppose,' she asked, 'down to the minutest detail, everything necessary to betray the League and put it up root and branch? You have taken good care to shield yourself, I presume?'

'Of course.—And now, to talk of more pleasant things. You know I am going away in a few days; and when I return, I shall expect to find myself perfectly free.'

'You may depend upon me. I will do all I can for you.'

Le Gautier looked up sharply—the words were coldly, sternly uttered, but the quiet placid smile never left her face.

'How strangely you speak! But oh, Marie—my Marie, the only woman I ever loved, you will stand by me now, and help me, for both our sakes! Look at me, and say you will do what I ask!'

Isodore looked down, smiling brightly. 'Yes, I will do what you ask,' she said. 'And so you really love me?'

'Passionately and sincerely, such as I never expected to love woman yet.'

'I am glad to hear you say that,' Isodore replied with a thrill of exultation in her voice. 'I have waited and hoped for the time to come; but never in my wildest dreams did I look for this.'

'With your nobleness and beauty, how could it be otherwise? I should be more than a man—or less—if I looked upon you unmoved.'

'Then, for the first time for years, I am happy,' Le Gautier started to his feet rapturously. He did not understand her yet; he thought the soft earnest words all for him. He would have caught her there and then in his eager arms, but again she repulsed him. 'No, no!' she cried; 'I have not loved you yet. Let things remain as they are till you return again to England.'

How strange, Le Gautier thought vaguely, that she should use words so similar to those of Enid to a precisely similar plea. Despite his passion, he had not thrown all prudence to the winds.

'You had better leave me now,' Isodore continued—'leave me to think and dwell over this thing.'

'But what about my badge of membership? I dare not leave England without that.'

'I had almost forgotten it in this interesting conversation. It is not in my possession; it is in Paris. You have a meeting of the League before you go for final instructions. Come to me after that, and you shall have it. I am going to Paris to-morrow, and will bring it with me.'

'You are a witch!' Le Gautier exclaimed with admiration. 'You seem to know as much as the mysterious Isodore, that princess who never shows herself unless danger besets the League. If she is the wonder men who have seen her say so, they stand in dire need of her now.'

'Beware how you talk so lightly of her—she has the gift of fernseed. At this very moment she may know of your perfidy.'

'Perfidy is a hard word, my queen, and sounds not prettily.—And now, good-night. And you will not fail me?'

'I will not fail you,' Isodore replied with the stern inflection Le Gautier had noticed before, and marvelled over. 'I never fail.'

'A woman, and never fail!'

'Not in my promises. If I make a vow or pledge my word, I can wait five years or ten to fulfil it.—Good-night. And when we meet again, you will not say I have belied my contract.'

When Valerie entered some minutes later, she found Isodore with firm-set face and gleaming eyes. 'My brother is dead,' she said quietly. 'Poor Carlo! And he loved me so at one time. Now, he can never know.'

'Dead!' Valerie exclaimed. 'You do not mean to say—'

'That Maxwell killed him?—No. His heart has been failing for years, long before I left Rome; his life was not worth an hour's purchase. But I have no time to mourn over him now.—Let me see if I can do a little good with my useless occupation. I start for Rome to-morrow.'

Valerie looked at her friend in stupid astonishment.

'I cannot explain to you now. Maxwell is free to return home. As you know, it means destruction to Le Gautier's plans, if he does. I dared not press him too closely to-night; but Maxwell will be detained in Rome, in all probability by Paolo Lucci, till some charge can be trumped up for his destruction. But Lucci and his band dare not cross me; my power is too great for that. To-morrow, I leave for Rome, and pray heaven that I may not be too late!'

AMERICAN TRAITS.

It is usual in this country to regard the Americans as a homogeneous people, and to accept the Yankee as a fair type of the whole nation. But this is a fallacy. The inhabitants of the South, and more especially the descendants of the early French and Spanish colonists to be found in the Gulf States, differ radically in their morals, manners, and customs from the population of other sections of the Union. It is not, however, our purpose in this paper to enter into an extended disquisition upon the characteristics

of the people of the United States, our object being simply to touch briefly upon a few of their more prominent traits. The Puritan element in the character of the first settlers of New England has exercised an influence upon social life there which has not been confined to that limited area, but has made itself felt, in a more or less marked degree, throughout the whole of the Northern States. The differences of race and climate have, however, not only been obstacles to the inhabitants of the South accepting the Puritan standard of morals, but have also prevented the development of those traits of character to be found in the population of other parts of the country, and which are more peculiarly distinctive of the Americans as a people. We shall therefore limit ourselves to dealing with those national characteristics which have come under our observation in the Northern States.

That submission to the will of the majority which is inculcated by democratic institutions has exercised a marked influence upon the social no less than upon the political life of the people of the United States, save in the late Slave States. It has not only had the result of preventing the development of individuality of character, but likewise has considerably modified that obstinacy of temper and dogged tenacity of opinion which are to be found in the Anglo-Saxon race. The late Lord Beaconsfield on one occasion said in the House of Commons that a gentleman who had spent several years in America had declared to him that it was his belief that 'the citizens of the republic were the most tractable people in the world, and the readiest open to conviction by argument.'

In the United States, the absence of that segregation of the various grades of society which exist in Europe is evinced by the habits and manners of the masses in that country. If the national independence of character be occasionally pushed too far, and degenerate into offensive self-assertion, at least it prevents any approach to servility. No inequality of position or circumstances will induce a native of any of the Northern States to submit to being dealt with in the manner or spoken to in the tone which, in England, the man in broad-cloth too frequently adopts, as a matter of course, towards the man in fustian. The late Sydney Godolphin Osborne used to relate how, once, a respectable artisan said to him: 'I like you, my lord; there is nothing of the gentleman about you.' The meaning of the speaker was undoubtedly that Lord Osborne did not treat him in the patronising manner that members of the higher class usually address those whom they regard as their social inferiors. Now, no one perhaps has a keener appreciation of the advantages of wealth and education than the American; but that the possessor of them should feel himself justified in using towards the man who lacks these adventitious gifts the language of a superior to an inferior, is what he cannot understand, and which he will not for one moment put up with. An anecdote Thackeray used to relate of an experience of his when in the United States well illustrates this trait of the people. While in New York, he expressed to a friend a desire to see some of the 'Bowery Boys,' who, he had heard, were a class of the community peculiar to that city. So one evening he was taken to the

Bowery, and he was shown a 'Bhay.' The young man, the business of the day being over, had changed his attire. He wore a dress-coat, black trousers, and a satin waistcoat; whilst a tall hat rested on the back of his head, which was adorned with long well-greased hair—known as 'soap-locks'—a stylo which the rowdies of that day affected. The youth was leaning against a lamp-post, smoking an enormous cigar; and his whole aspect was one of ineffable self-satisfaction. The eminent novelist, after contemplating him for a few moments with silent admiration, said to the gentleman by whom he was accompanied: 'This is a great and gorgeous creature!' adding: 'Can I speak to him without his taking offence?'

Receiving an answer in the affirmative, Thackeray went up to the fellow, on the pretext of asking his way, and said: 'My good man, I want to go to Broome Street.'

But the unlucky phrase, 'My good man,' roused the gall of the individual spoken to. Instead, therefore, of affording the information sought, the 'Bhay'—a diminutive specimen of humanity, scarcely over five feet in height—eyeing the tall form of his interlocutor askance, answered the query in the sense that his permission had been asked for the speaker to visit the locality in question, and he said, patronisingly: 'Well, sonny, yer kin go thar.'

When Thackeray subsequently related the incident, he laughingly declared that he was so disconcerted by the unexpected response, that he had not the courage to continue the dialogue.

The question, however, differently put would, in all probability, have elicited a civil answer from ninety-nine out of a hundred of the members of the class to which the man belonged. In fact, the discourtesy, and even rudeness, of which some travellers in the United States complain have arisen from the fact of their failing to appreciate the difference existing between the social systems of that country and their own.

The wide gulf in culture which in England separates the upper and middle classes from the lower orders, does not exist in America. This has arisen from various causes. In the first place, the great bulk of the people of the Union are much better educated than is as yet the case in this country. The admirable system of common or, as they are termed, 'public' schools which prevails in America affords facilities for all children obtaining a sound English education without the payment by their parents of any school fees, and at a trifling cost to the taxpayer in all sections of the Union, and especially in the West, where large grants have been made of the State lands in support of the public schools. In the second place, the social status of the working classes who are natives of the United States has been raised by the fact that the Americans are almost exclusively engaged in vocations demanding intelligence and skilled labour. This has been owing to the circumstance that upon the coloured population and the Irish and German immigrants have devolved those coarse and irksome occupations which have to be followed by a portion of the inhabitants of other countries. To give one instance of this alone, it may be stated that rarely is a native American citizen, man or woman, found occupying the position

of a domestic servant in any of the Atlantic cities.

The wages, too, commanded by artisans and mechanics averaging nearly double those of the same class in other countries, it follows, necessarily, that vice and crime—the inevitable concomitants of a state of society in which the condition of the mass of the lower classes is but one step removed from absolute indigence, as is the case in most European countries—are not nearly so prevalent in America. In the New England States, where the foreign population is small, there is not a country in Europe—possibly with the exception of Holland—where there is so little crime. Few persons, indeed, are aware how much the foreign element in the community, in many of the States, contributes to the statistics of the offences which come under the cognisance of the criminal tribunals. In the State of New York alone, seventy per cent. of the infractions of the law are committed by the Irish, whilst the fair ratio of this class in proportion to the whole population would be a little less than twenty per cent.

One of the most marked characteristics of the Americans is their rooted determination to resist any legislation which shall recognise any class distinctions in the community. Of course, no one contends that the man of wealth, education, and culture is not the superior, in one sense of the word, of him who lacks these. The equality insisted upon is simply this: that no class of society shall make the circumstance of enjoying these adventitious advantages a ground for the members of it basing a claim to be a separate caste, possessing rights and privileges—fenced in by law—denied to the bulk of their countrymen. This sentiment found expression in the opposition which the proposal met with, a few years ago, that persons in the Civil Service of the Federal government should be irremovable, save for misconduct, instead of being turned out of their places after every change of administration, as had previously been the case. It was argued that fixity of tenure of office would have the result of creating a bureaucracy, the members of which would come in time to regard themselves as a privileged class. That these apprehensions were unfounded, experience of the practical working of the new system of government patronage has proved. But the very fact of the objection having been raised at all shows how sensitive public opinion was on the subject.

One noticeable feature of American society is that in none of the Northern States does an officer in the army or navy enjoy the social status that he commands in all European countries. Holmes, in *The Autocrat of the Breakfast Table*, has commented upon this trait of his countrymen. He says: 'It is curious to observe of how small account military folk are held among our Northern people. Our young men must gild their spurs, but they need not win them. The equal division of property keeps the younger sons of rich people above the necessity of military service. Thus, the army loses one element of refinement, and the moneyed upper classes forget what it is to count heroism amongst their virtues. Still, I don't believe in any aristocracy without pluck as its backbone. Ours may show it when the day comes, if ever it does come.'

The opportunity for young men of the wealthier class proving their manhood came sooner than Holmes anticipated when he penned the above remarks; for less than three years later, the civil war broke out, and then this class were not slack in responding to the call of their country for their services. Numerous instances occurred of young men reared in luxury—unable to obtain commissions owing to their want of military training—shouldering muskets in the ranks of the Federal armies; and their patriotism received due recognition from their fellow-citizens. But in time of peace it is the members of the community who are engaged in those pursuits best remunerated who are held in the highest estimation—a necessary result of a condition of society in which wealth is the standard by which social position is measured and defined. The girl who in the French song exclaims, 'Oh! que j'aime les militaires!' utters a sentiment which as a rule finds no echo in the hearts of the American fair. An odd illustration of this fact came under the observation of the writer when he was resident in New York. A lady—whose brother had been educated at the government Military Academy at West Point—gave, in all seriousness, the reason why this gentleman, after graduating, had not accepted a commission in the army, in these words: 'He had a higher ambition than to be a mere soldier, so he has become a dry-goods merchant.'

In New York, and indeed in all the larger Atlantic cities, a class has sprung up of late years which affects to look down upon the political and social institutions of their country. Mr Howells, in his novel *A Woman's Reason*, speaking of one of the Upper Ten, says: 'He saw what a humbug democracy and equality really were. He must have seen that nobody practically believes in them.' This sentiment may accurately reflect the opinions of a limited class, but it is an absolute fallacy to assert that such views are generally entertained. On the contrary, they have not to any appreciable extent permeated the people at large, and there is not the slightest likelihood of their affecting the national life or changing its standards.

In closing these desultory observations upon some of the characteristic traits of the Americans, the writer may state that they are based upon personal observation during a residence of several years in the United States.

COUSIN GEORGE.

IN TWO CHAPTERS.—CHAP. I.

MR NICHOLAS SMETHBY lived, in pretty easy circumstances, at a town some thirty or forty miles distant from London, from which metropolis he had retired on leaving off business. His profession had been, nominally, that of an accountant; but he had seldom troubled himself greatly about accounts, and had not received many commissions to investigate them. He had really been a speculator in stocks and shares, in a small but profitable way; and while he lent but little of his own money in loans, had made a great deal of profit as agent, or 'middleman,' between those who wished to borrow and those who were able to lend. So Mr Smethby had

lived in a circle in which it was necessary for him to have his wits about him, and in which a somewhat decided hankering for gain was likely to be developed; yet in this he was perhaps no worse than most of his neighbours; while, 'cute as he was, he was not a bad sort of fellow, take him altogether. He was pleasant and social enough in his family circle, a pretty large one, but reduced, as far as his own household was concerned, to one daughter, Harriet, the other mothers having married. Two of these had settled in the neighbourhood of Valeborough, the town referred to; while Mr Smethby had long been a widower. He had no other relations, that he knew of, and, as he was wont to say when speaking on the subject, he did not want to hear of any. His cousin, George Styles, was the last he had had much to do with, and, ah!—Mr Smethby would exclaim at such times as the subject was brought up—he did not care about any more like him.

'Twenty years ago, sir,' he would explain, 'he called on me with a cock-and-bull story of his being in trouble and wanting to get to Australia; and I was fool enough to lend him twenty pounds. Yes, sir, lent twenty pounds to a man I did not care two straws for, and had seen hardly a dozen times in my life. What was the consequence? Why, I never heard any more of him or my twenty pounds either, and don't know to this day whether he went to Australia or not. I should decidedly say *not*. That is all I know about my relations.'

It must be owed that it was at the best a selfish kind of cheerfulness, which was derived from the belief that he had no kith or kin out of his own household; but Smethby was rather a selfish man. He certainly was too fond of talking in this train.

It happened that, towards the close of a bright June day, Mr Smethby was at a railway station some two or three miles from his residence. To aid in identifying the town, we may say that there was another line which ran through or at least close to it; but from the station in question, an omnibus plied to Valeborough, and it was for this vehicle that Mr Smethby waited on the little platform.

'We shall have a wet night, I expect,' said a voice in his ear.

He looked round, and saw a sailor-like man, whom he had already noticed, and who was scanning the horizon in a sailor-like manner. Mr Smethby made a fitting reply to this remark, and a desultory conversation ensued. The expected omnibus now coming into sight as it crossed a rise in the road at some distance, Smethby instinctively shifted his valise a little nearer to the gate. The man good-naturedly helped him, as he was close to the bag, and exclaimed, as he saw the label upon it: 'Smethby! It is odd that I should see that name to-day, for it is not a common one.'

'I do not think it is often met with,' said Mr Smethby. 'But what is there odd in your seeing it to-day?'

'Well, perhaps not much,' replied the man, with a smile; 'but I was talking about that name a good deal yesterday, and for weeks before.'

'Indeed! May I ask how that was?' said his listener.

'I have just come from Australia,' returned the sailor. (Mr Smethby could not help growing suddenly attentive at this.) 'I landed yesterday at Gravesend, and bade good-bye to an old chum. Ah! he was a good chum too! Five years had I worked in the next claim to old George, as we called him. His right name was George Styles.'

'George Styles!' exclaimed Mr Smethby.—'But I must apologise for interrupting you.'

'He had done well—better than any of us,' continued the sailor. 'Some folks said he was worth a quarter of a million of money; but I never believed that; about half the figure would be higher. He said he had no friends in England he cared for now, except one Mr Smethby. That is why the name startled me. He was always talking about him. It was on purpose to see him he went on to London with the ship; he lives somewhere in the City.'

'O—h!' said Mr Smethby. This was a long-sustained syllable, the gentleman having a curiously complicated rush of thought just then.

'Yes, he lives in London; and I think old George means playing a rare trick on him,' said the sailor, whose smile broke into a laugh here. 'He used to say what a game it would be to go and pretend he was poor and broken down, so as to see who were his real friends and who were not. It is my belief he will do it too; and when I go back to London, I'll try to find him out, to hear all about it. Ha, ha, ha!'

The omnibus drew up at this moment; and the sailor, knowing their conference must end, touched his cap and drew back.

'A—was this George Styles really so rich? I ask, because your story has interested me,' said Mr Smethby hurriedly. 'He must be a droll fellow!'

'Rich! Why, I've seen with my own eyes the banker's receipts for the best part of a ton of gold of his, first and last,' returned the sailor; 'and that was only a part of his luck. His last words to me were: "Bill"—my name is Bill Brown—"Bill, as long as I live, you shall never want a friend." Nor I shan't, I know.—Good-day, sir.'

Mr Smethby entered the vehicle, and had a silent, thoughtful ride to Valeborough. The sailor's conversation, helter-skelter and rattle-brain as it was, had furnished him with much food for thought; and finding that his son was at his house, when he arrived there—this son was married and settled at Valeborough—he immediately took him, with Miss Harriet, into council. During his narrative, repeated exclamations of astonishment broke from his hearers.

'Why, father,' cried his daughter as he finished, 'this must be your cousin George; and you are the Mr Smethby he is looking for.'

'Of course I am; I saw that at once,' replied her father.

'But what is to be done?' asked Mr Joe, the son. 'You have left London for years; he may be looking about for you till doomsday, and be no nearer finding you.'

'I suppose he will go to my old address. The people there know where I am, and will send him down,' said Mr Smethby. 'I expect that is how it will be.'

'I hope so, I am sure,' continued his son; 'otherwise, we may lose a splendid chance.'

Smethby could not help admitting the possibility of this, which seemed to disturb him a good deal, yet nothing could be done to avert it.

'We must be careful to show him every kindness,' said Harriet. 'After having been away from England so long, he will feel pleased at it.'—

'Leave me alone,' interposed Smethby, with a nod and a wink, which meant much. 'I flatter myself I can see my way here pretty clearly. I only hope he comes, that is all.'

Mr Smethby would have written to his successors in London, asking them to give his address to any inquirer; but he abstained, partly because he felt sure they would do this in any case, but chiefly from the danger that his request might be mentioned to his cousin, and so show that he, Mr Smethby, had a knowledge of his arrival in England.

No days in the lives of Mr Smethby and his family had ever appeared so long as each of the next two or three which followed their little family interview. The suspense was—as the elder gentleman pronounced it to be—'excruciating'; but it came to an end in time.

Mr Smethby was in his front-garden in the afternoon, trying to occupy himself; but his mind was busy on a subject very different from botany, when, happening to look up from his flower-beds, he met the eyes of a man who was watching him over the fence, as this man stood on the footpath. He smiled when he met the glance of Smethby, who actually recoiled in his astonishment; for although he had been thinking without cessation of his cousin, yet it was like an electric shock in its suddenness to look round and find the very man face to face with him; for this was, must he, he felt, George Styles. He did not know him, had no recollection of his features; but the bronzed, bushy-whiskered, bushy-bearded man, dressed something like a sailor, yet not to be mistaken for one, who smiled at him across the garden fence, was his cousin, there could be no doubt of that.

'Well, Nick, old fellow!' began the stranger; 'I see you know me, although it is many years since we parted.'

'Why, it is George Styles!' exclaimed Mr Smethby, with an assumption of surprise and 'gush' which did him infinite credit, and of which he felt secretly proud for a good while. He seized the other's hand and wrung it over the fence with a prolonged heartiness, as though he could not bear to relinquish it. 'My dear old boy, how glad I am to see you!' he resumed, as soon, it appeared, as his feelings would allow him to speak. 'Come in. How did you find me out? But never mind that now. Come in! I shall have a thousand things to talk about.—This is Harriet; the only unmarried one now; she was in arms when you went away, so I don't expect you to remember her.—Now, Harriet, let us have a cup of tea; and put the best we have in the house on the table to-day, if we never do so again.'

'You are almost too kind, Nick,' said the other, and there was really a little catch in his voice as he spoke. 'I did not expect—indeed, I don't deserve such generosity. I think I had first better run down to the *Railway Tap* and bespeak my room there, for I hope to stay three or four days at Valeborough.'

'Three or four days!' exclaimed Mr Smethby; 'bespeak a room at the *Railway Tap*! I don't mean to part with you, now I have found you again, under three or four months; and if you do not make this your home for everything, I—I—I'll never forgive you.'

Miss Harriet, in an equally gratifying strain, indorsed these sentiments, at which Styles was evidently affected.

'I did not expect—could not have hoped for this,' he returned; 'and seeing that I have returned a—a poor man'—the awkward stop he made, ere he could get this out, amused Smethby—'it is so kind of you. If it will not cause any inconvenience, I will stay here a little while, and I will do anything I can to repay your generosity.'—

Here he was interrupted by the good-tempered laughter which such an idea excited, and the evening passed off merrily.

Mr Joe and his wife looked in—by chance, as they explained; as did Mr Brooks and his wife—formerly Miss Susy Smethby—who came also by chance; the result being that there was quite a jovial party, and that Mr Styles received the warmest invitations to become a frequent visitor at the house of Mr Joe and at that of Mr Brooks.

After this night, too, there was unwonted pleasantry at Mr Smethby's, for not only his family but some of the neighbours were constantly dropping in, and it was wonderful what an interest they all took in the gentleman from Australia. The latter was very guarded—kept up his character well, did him great credit, Mr Joe said. But no one can avoid an occasional flaw, and one or two were detected even in him. He was wont to deplore the hardships which unsuccessful men suffered in a colony—in fact, he did not like to enter on any detail of his painful experiences—never would do so.

'Your hardships do not seem greatly to have injured you, George,' his host would answer; 'you look a good ten years younger than your age; and many a man who has never been fifty miles from London shows the wear and tear of toil and worry, of which you complain so much, more than you do.'

'Ah! but it is the future!' Mr Styles would say, when such a debate arose—he would say it with a sad shake of the head—'it is the future which preys on my mind, what I am to do for the rest of my life.'

It was difficult for Mr Smethby, knowing so much as he did, to listen gravely to such arguments as these; but he was grave, and his manner encouraged Styles to confide in him—after a fashion.

He soon showed an interest in speaking of certain Australian investments which it appeared some friend of his thought highly of; a shallow ruse, not likely to deceive such a man as his cousin. Styles further mentioned that a gold-miner whom he knew had put ten thousand pounds into one of these specles less than two years before, and he could now sell out for thirty thousand any day he chose; but he was too good a judge to do that, as in another two years the present value would be doubled, and then, perhaps, he might be tempted to realise. This same miner, as he had heard, held five or six

other investments, nearly all as good, and was in expectation of hearing news which would enable him to employ the other half of his capital, which was now lying idle—only making a paltry three per cent.—quite as well. All this Mr Styles had heard from his friend.

All this amused Smethby, who read his visitor the more thoroughly in proportion as the latter sought to envelop himself in these far-fetched disguises. No additional proof was needed to satisfy Smethby; but the evidence was in a manner forced upon him to expose most completely the absurd trick which his cousin was attempting to play off upon him.

Harriet found a letter on the floor of their visitor's room; it would have been expecting too much from the feminine, or perhaps from any temperament, to suppose she would not read it. Its contents were so interesting, although exceedingly brief, that she showed the note to her father. It was from a firm in London, a stockbroker's evidently, referring to some inquiry from 'George Styles, Esq.' as to the purchase of shares to the amount of twenty thousand pounds, in the Bodganaree mines—the very speculation that Smethby had heard his cousin refer to in their last conversation as being in great favour with the unnamed gold-miner! The shares were low at present, the letter said, and could be bought at about eighty per cent., so that a little over sixteen thousand pounds would be sufficient.

'That settles it, then,' said Smethby. 'Be sure to put the letter back where you found it, Harriet; and mind what I told you the other day. Play your cards properly, and I am sure you will win.'

This utterance was rather obscure; but his daughter understood it well enough to induce her to pout and frown a little, and to move with what is generally described as a 'flounce.'

'Ah! it is all very well,' said the gentleman; 'but you ought to know better than to dream of allowing a quarter of a million of money to go out of the family.—Who is Robert Crewe, I should like to know?'

This speech would have been, to a third party, equally obscure with that which had gone before; but as we do not wish to have any mystery, we may explain that, almost from the first, Cousin George had appeared much impressed by Harriet's good looks, and had shown her attentions which gradually became more marked. He was five-and-twenty years older than the girl, it was true; but as he had himself said to Smethby, a man ought to be a good deal older than a woman, when they marry; and when a man had been abroad, knocking about the world best part of his time, he then knew what a home was, and felt the want of a young and cheerful wife.

All this Smethby had pointed out to his daughter before; but was shocked to find—for he really considered her a sensible, clear-headed girl, as a rule—that a ridiculous friendship with one Robert Crewe, a doctor's assistant in the town, blocked the way of this new road to wealth and position.

Robert Crewe! Smethby had not ordinary patience with the idea. He admitted that he had known of, and in some sort of way approved, or, rather, had not forbidden this intimacy—it was in this roundabout manner he now described

his conduct—and the young fellow, in his place, might be well enough; but to compare him and his miserable gallipot and sticking-plaster prospects, with George Styles, was enough to put any man out of temper. Robert Crewe, forsooth!

Yet, with all this natural indignation and in spite of this sarcasm, Miss Harriet could not quite make up her mind to renounce the young doctor; but it might come in time.

That very night—after the discovery of this letter, we mean—Mr Styles on his return broached two subjects which were strongly suggestive, especially when his hearers were behind the scenes to a degree he did not suspect. These hearers were only Mr Smethby and his daughter. It was a quiet night, such as delighted Mr Styles; he really appeared to enjoy himself pretty well under all conditions; but he declared this evening that a snug little family chat was sweeter than anything else, to an old wanderer like himself. Port, sherry, and claret were at hand; for while Smethby was, as a rule, strictly economical, so that wine rarely appeared at his table, his hospitality to his cousin led him into a freer display of such luxuries now, than of old. But the taste of Mr Styles was simple—old-fashioned, he said; and he drank scarcely anything but cold brandy-and-water, to which he was remarkably partial. It was over a glass of this innocent beverage—always mixed half and half, at which, even in his bloom of hospitality, Mr Smethby winced—that he spoke of the subjects indicated. He referred to a friend of his—it was odd how satisfied he seemed with this shallow artifice, and how often he resorted to it—who was about to buy a small property near London. This property was at Richmond—only a mere toy, a little villa, with coachhouse and stables; a pretty conservatory, with a couple of acres of land—that was all. It was freehold—his friend would have nothing else—and it commanded the prettiest view on the river.

Now, what was Miss Harriet's opinion? Did she prefer living in the country outright, or near London? What did she think of his friend's choice? Harriet hesitated, and her colour went and came; but Smethby spoke up for her, and said that, like every other young girl, she would prefer living near the great metropolis, with its theatres, its balls, its parks and the like.—O yes! of course. Harriet but feebly echoed this opinion, which was repeated and enlarged on by Smethby.

Later in this evening, when the elders were alone, Styles brought up his friend again; it was, as before, in reference to an investment, and Mr George said how he wished his cousin had a little money to spare, as he knew—his friend knew, that was—a chance for doubling and troubling every penny invested.

Smethby, with his usual good-tempered laugh—he was always good-tempered, when with Styles—said that for all George knew his might have a trifle by him. On hearing this, his cousin expressed his pleasure, and said that his friend was going to invest nearly twenty thousand pounds in the spec. Such figures were beyond Smethby, as that gentleman owned; but one, or even two thousand, he might command. In short, ere they parted that night, he had resolved to remove his cash from his deposit account at

the town bank and join this friend in his speculation.

Styles was pleased to hear this; and when Smethby said he should like to see his friend, laughed, and confusedly said he would tell his cousin more about him soon.

ECONOMY OF FUEL.

MR HULL, a celebrated geologist, has calculated that there is still a quantity of coal in store in England and Wales sufficient to afford a supply of one hundred and twenty millions of tons for about five hundred years. This would be a cheerful estimate, if we could cordially and unquestioningly accept it. But, unfortunately, we cannot, other competent observers having affirmed that the coal deposits of this country will be exhausted in less than two hundred years. We would, therefore, urge with all earnestness, that the people and the government should pay more especial attention to this vital subject than they have hitherto done.

Of course, there are two chief points on which any interference could be effectual: these are, the exportation of coal, and the wasteful processes of mining now in vogue. The former of these involves the great question of free-trade, and the right of each coal-proprietor to sell the produce of his land and labour at the best possible price. The latter is even a still more difficult thing to meddle with, and must, perhaps, be met rather by the provisions made on the part of landed proprietors, when leasing their subterranean property to practical miners, than by anything government can do. At present, the proprietor, having a life-interest in his estate, desires to obtain from the mines the largest amount of the most valuable coal at the smallest working loss. The result is, that vast quantities of inferior but yet valuable material are left in the pits; quantities that would do something towards meeting the growing consumption in this kingdom.

Selfish, narrow-minded people might exclaim: 'Oh! there will be quite enough of coal to last us our time. We don't expect or want to live for ever; therefore, we won't bother ourselves about the economy of fuel.'

Let us remind such unpatriotic mortals that our manufacturing and commercial interests rest upon our supplies of coal as their foundation-stone. Our commercial rivals across the Atlantic possess magnificent coal-fields, that are practically of indefinite extent. Exhaust our coal-fields, and their supremacy will become complete. It behoves each and every one of us to think of the future of our country and of the interests of those who come after us.

Perchance some cynic may say: 'What has posterity ever done for me? Let posterity take care of itself.'

'Very well,' we reply; 'let posterity do for itself. Let us only be influenced by selfish and non-altruistic principles, and think only of ourselves. The question is, how can we put money into our own pockets by using less coal than we do?'

First, we can do so by using proper grates. Down to the time of Count Rumford, the modern world of coal-burners never thought of the true

theory of caloric in connection with grates. Burners of wood had not tried to be economical; they did not expect to be warm on more than one side. When their bodies were scorched and their eyes smarted, they had what they bargained for. Rumford appeared as a new teacher; he laid down the principles of heat and combustion with admirable clearness, and flooded England with grates of his favourite type. But in spite of the teachings of the Count, coal-fires of to-day are as dirty, chilly, and as wasteful as ever.

The waste of coal in Britain is positively disgraceful. One hundred and twenty millions of tons are consumed every year. Of this, one half might be saved by the adoption of improved appliances. About thirty million pounds sterling might thus be kept in our banks, instead of being turned into cinders and smoke. The pall of smoke and fog that broods over London contains in a single day fifty tons of coal! The fact is that we burn coal in house-fires on an entirely false principle—that is, on the principle of a blast-furnace, letting cold air pass through the centre of the fire, to blaze the coal rapidly away, and hurry the heat and half-burnt gases unused up the chimney. We have to go back to the good old principle of the embers on the earth, when the hearth was, as it is at the present day in many Irish cottages, a true 'focus,' a centre of accumulated heat. We must, then, return to truer lines, and make our fireplace again a 'focus' or 'well' of stored heat, into which we put our fuel, first to be distilled into gas, which, rising at a high temperature from its hot bed, meets the air gliding towards the chimney, and bursts into flame, communicating heat to the firebrick back and to the room. Then, when all the gases have been burnt off, the red-hot coke remains, and burns away in the bottom of the grate at a slow rate, yet radiating abundant heat into the room.

This desirable end is gained by using Mr Teale's 'Economiser.' The 'Coal Economiser' is simply a shield of sheet-iron which stands on the hearth, and rises as high as the lowest bar of the grate, against which it should fit accurately, so as to shut in the space under the fire. Any ordinary blacksmith can make the 'Economiser.' It is applicable to any range, whether in the cottages of the poor or the mansions of the rich. Those who wish for greater elegance can have it made of steel or brass. Its chief purpose is to cut off the under current, and to keep the chamber under the fire hot.

Count Rumford affirmed that seven-eighths of the heat was carried up the chimney. Heat is wasted in three ways: by combustion under the influence of a strong draught; by imperfect combustion; by the escape of heat through the sides and the back of the fireplace. By using the 'Economiser' all this is altered. If there is plenty of heat round the fuel, then but little oxygen will do. But burn coal with a chilling jacket, and it needs a fierce draught of oxygen to sustain it. High temperature does not imply complete combustion, for in making gas, coke is left. When the 'Economiser' is applied, the fire burns with an orange colour, for the stream of oxygen is slow and steady, and the coal undergoes complete combustion; consequently, there is an entire absence of cinders, and only a little

fins snuff-like powder falls into the 'economised' chamber. Smokes is also conspicuous by its absence.

In a recent lecture delivered at the Royal Institution, Mr Teale mentioned several additional points about the structure of fireplaces, which tend to the saving of fuel. (1) As much firebrick and as little iron as possible should be used. Iron absorbs the heat, and chiefly in directions in which the heat is least wanted. Firebrick retains and accumulates heat. (2) The back of the fireplace should lean or arch over the fire, so as to become heated by the rising flame. The heated back sends forth abundant radiant heat into the room. 'Milner's' back is a capital arrangement; so is the Nelson 'Riffo' back. (3) The bottom of the grating should be deep from below backwards. (4) The slits of the grating should be narrow; this prevents small cinders from falling through. (5) The bars in front should be narrow.

If the foregoing instructions are attended to, there will be an enormous saving of fuel. Soot and smoke will be diminished, and there will be no half-burnt cinders.

The late Sir William Siemens was an ardent advocate for the use of gas as a heating agent. At the British Association of 1882, he said: 'The time is not far distant when both rich and poor will largely resort to gas, the most convenient, the cleanest, and cheapest of heating agents, and when raw coal will only be seen at the colliery or gasworks. In all cases where the town to be supplied is within, say, thirty miles of the colliery, the gasworks may with advantage be placed at the mouth, or, still better, at the bottom of the pit, whereby all haulage of fuel would be avoided, and the gas in its ascent from the bottom of the colliery would acquire an onward pressure sufficient, probably, to impel it to its destination.' No doubt, if this scheme could be realised, we would all be deeply indebted to the great man who first suggested it. More than one half of the coal now consumed would be saved by its adoption. At present, we must be content with the old order of things.

It is astonishing, however, that so few people employ gas instead of coal as a cooking agent, especially in summer. It secures an immense saving of labour, not to speak of its superiority over coal in respect to coolness. In the hot summer days, cooking with a coal-fire in an ordinary range is a tremendous trial to the poor cook. The kitchen is like an oven. What a difference if gas is used! The moment it is no longer required it can be turned off, and the temperature of the kitchen is soon lowered. By using a gas-stove, no coal is required during the summer. It is less expensive than coal. Of course, care must be taken to have it turned off directly it is no longer required, and a proper economy exercised in its use. Mr Fletcher, of Warrington, a high authority on gas for cooking and heating purposes, says: 'The cost of gas, even if wastefully used, must be considered not only as regards the saving of coal, but also, what is far greater, the saving in weight of meat roasted, which is considerable, and the reduced wear and tear, waste, dirt, and consequent labour. Taken altogether as affecting the total housekeeping expenses, gas is cheaper than

coal for cooking at any price not exceeding twelve or fourteen shillings per thousand cubic feet; coal being, say, twelve to fourteen shillings per ton.' The majority of people, however, pay very much less for their gas, and more for coal; in which case, gas will be much cheaper than coal.

Asbestos heated by gas makes a suitable fire. It is cleanly, quiet, free from dust, and convenient; and it can be turned on or extinguished in an instant.

Enough has been written to show that economy of fuel is not merely theoretical and fanciful, but that it is practicable and worthy of earnest attention.

THE SIGN OF THE RED INDIAN.

JUST on the outskirts of the seaport and garrison town of Chubleigh, in the south-west of England, stands a little old-fashioned bostelry called the *Red Indian*. How it came by its name is involved in obscurity. The antiquity of the inn is undoubted, and a tradition is current in the district, that during the unfortunate Monmouth's rebellion it was used as the temporary headquarters of Colonel Kirke. In its back-garden, a wooden seat is still shown to visitors on which that bloodthirsty officer, surrounded by his 'lambs,' is alleged to have sat in judgment, and thence ruthlessly consigned to the gallows scores of the unoffending rustics of the locality. From time immemorial, the *Red Indian* has been in the hands of a family named Slade. The present proprietor, though, generally speaking, as deliberate in manner as John Willet, is yet apt to be garrulously communicative in talking of his inn and its interesting historical associations. Above the rustic porch over the door there is fixed a large, rudely carved, wooden figure of a savage holding in its hand a tomahawk. The Indian's nose was long ago knocked off by a well-directed stone thrown by some mischievous urchin; his original coat of paint has peeled off, and large cracks are visible, which run the whole length of the figure. Altogether, this Indian is as disreputable-looking a sign as a traveller might perceive throughout the length and breadth of England. Nevertheless, it is in connection with this dilapidated timber savage that the writer obtained, from the landlord of the *Red Indian*, materials for the following story.

When the present century was in its infancy, the son of the then proprietor, and grand-uncle of the present landlord, was engaged in the capacity of boatswain of a privateer, which had been fitted out with the object of preying on the French merchant service. In the Mediterranean, this privateer captured a large vessel, which in part was laden with the product of the labours of a Parisian curiosity-hunter, who had been despoiling ancient Grecian temples, with the object of supplying the virtuosi of the French metropolis with antiques sculptures and bronzes, and thereby securing a large profit to himself.

The privateersmen were greatly disappointed at not finding specie, and what they considered marketable merchandise, on board the Frenchman, and attached but little value to the battered though priceless bas-reliefs and statues. Boatswain Slade took a great fancy to a life-sized bronzo gladiator, which he considered would prove an acceptable addition to the attractions of the back-garden of his father's inn, and managed, for a few shillings, to effect its purchase from the captain.

Shortly after the glorious victory of Trafalgar, the privateer was paid off at Chubleigh; and the boatswain conveyed the statue on shore to his father's inn. The gladiator was placed on a brick pedestal, flanked on either side by two rusty carronades; and the bareness of the surroundings was relieved by the artistic disposal of a number of huge shells which the boatswain had brought from 'foreign parts.' The host of the *Red Indian*, however, was soon struck by the idea of making the figure a sign for his hostelry. He had but little sentimental regard for the rich green mould of antiquity, so, with execrable vandalism, carefully scraped it off the statue, and had the gladiator painted a bright scarlet by a local artist, who took payment for his work in the old ale for which the hostelry was famous. This operation performed, the metamorphosed gladiator was removed to a prominent position in front of the inn door, and for years did duty as a *Red Indian*. Its brilliant appearance was a perpetual source of gratification and delight to the host and his numerous customers; while inquiring strangers were proudly informed that it had been captured from the frog-eaters. Once a year the extemporised *Indian* received a fresh coat of paint; and save when its head was decorated at times with a disused tin pail or an old hat by some facetious individuals, it was not otherwise interfered with.

At the close of the year 1815, Chubleigh was *en fête* in connection with the disembarkation of the 31st Regiment of Light Dragoons, which during that year had performed doughty service at Waterloo, and which had just returned from the occupation of Paris. The piping times of peace had again returned, and, naturally enough, the officers and men who had assisted to destroy the power of the once dreaded 'Bonny' were the objects of popular pride and enthusiasm among the inhabitants of the town. When the regiment settled down in quarters, invitations to the houses of the principal townsmen were showered on the officers, and each vied with the other to entertain these heroes of Waterloo.

The younger officers, several of whom had left school to join their regiment in Belgium, gave themselves prodigious airs; but no one considered himself of so much importance as a raw young Connaught-man, a cornet named Mike Macnamara. Mike, a warrior of about nine months' service, created great amusement both in the officers' mess and in the houses to which he was invited by boasting about the number of Frenchmen whom he had placed *hors de combat* in the late short but eventful campaign. His bounce together with his extreme simplicity rendered him the butt of his brother-officers, and he was in consequence the victim of numerous practical jokes. In these days,

and for many years subsequently, rough horse-play and the perpetration of the most uncomfortable imaginable practical jokes were characteristic of the spirited gentlemen who officered the regiments of British cavalry. Those of our readers who took the trouble, some years ago, to wade through the evidence at the Tichborne trial, will remember the description of the ruthless tricks played on the simple undoubted Roger by his brother-carabineers. At the present day, military practical joking is somewhat out of fashion, and any games that may be played are curtailed of their former disagreeable proportions, and have assumed a comparatively mild character.

Cornet Macnamara's room was the favourite arena for a display of the ingenious tricks of his facetiously inclined brother-officers. Thistles and dead cats were placed between his sheets; trapsful of live rats were let loose in the apartment; the nuts of his iron bedstead were unscrewed, so that when the poor fellow turned in, the framework of the couch tumbled to pieces and landed the mattress on the floor, while at the same time he was drenched by a tub of water from the shelf above, which was fastened with cord to the mattress, and upset simultaneously with the collapse of the bed. On such occasions Mike was naturally wroth, and expressed himself as anxious to call out the offenders; but despite his utmost vigilance and caution, he could never capture his tormentors.

Late one evening, a party of revellers from barracks were passing the *Red Indian*, when they espied the vermilioned gladiator. Nothing would satisfy them but to feloniously remove the statue and return with it to quarters—a work of considerable difficulty, as the figure was heavy. Arrived thither with their load, some one suggested that it should be placed in Cornet Macnamara's room; and this idea was hailed with general enthusiasm. A scout was despatched to the messroom, in order to keep watch on Mike's movements, and give the alarm in case he should appear on the scene. With great labour the gladiator was hoisted to the top of the staircase of the officer's house; and Mike's room door having been forced open, the jokers placed the statue in front of his dressing-table, on the top of an inverted iron coal-box. The staircase at the time was in process of being whitewashed, so the officers obtained possession of a tub of the mixture, and smeared the '*Red Indian*' a dirty white; then taking the sheets from Mike's bed, they hung them about the figure, turning it into a respectable-looking ghost. Afterwards, the officers dropped one by one into the messroom, and joined a group who were listening with great amusement to a new-fangled story which was being retailed by Macnamara regarding his prowess at Waterloo.

Mike, after clapping an additional two Frenchmen to the previous grand total of the number who had fallen by his sword, as narrated in his tale of the previous night, left the messroom in order to proceed to his quarters, whither, in a minute or two, he was stealthily followed by the whole of the officers, who anticipated great fun from the consternation of their victim when beholding the ghastly apparition in his bedroom. Mike gaily entered the apartment, singing

a love ditty of his native land, and began to fumble for his tinder-box. After several attempts, he at last managed to light his candle, and of course at once perceived the ghost. The cornet was filled with the superstitious notions of a certain section of his countrymen, and started back nearly overcome with terror. 'Ye saints in glory! what's that?' he cried; then leaving the room, he plunged madly down the staircase, and rushed yelling across the parade ground in the direction of the messroom. In his headlong progress, poor Mike did not observe a party of two ladies and a gentleman, who happened to be the colonel, accompanied by his wife and daughter, who had just returned from a dinner-party. Mike ran full tilt against his commanding officer, and knocked him into a puddle in the barrack square. The ladies screamed loudly; and the colonel, with many objections, got on his feet and confronted his assailant.

'You—Cornet Macnamara!' he angrily exclaimed. 'What do you mean, sir, rushing about like a madman at this time of night? Consider yourself under arrest, sir.'

'Faith, colonel,' answered the unfortunate Mike, 'I am very sorry, sorr, but I did not perceive ye. But, sorr, I wint up to me room just now, and as I hope for salvation, I found the devil in it, wid a big white shate wrapped round him!'

The irate colonel at once surmised that another trick had been played on his subordinate; so he sent the ladies home to quarters, and then called loudly for the sergeant of the guard with a file of men.

When this detachment of the guard appeared on the scene, the colonel ordered them to follow him to Macnamara's room, where, by the light of the sergeant's lantern, he showed the trembling cornet that there was nothing supernatural in the character of the figure that had frightened him so much. He then, under the circumstances, relieved Mike from arrest and proceeded home.

Mike waited until the commanding officer and the men of the guard were clear of the staircase, and then slid the gladiator off the coal-box. He edged the statue to the top of the stair, and by main strength toppled it over the banister; and an instant later, with a loud crash, the gladiator was smashed into fragments on the flagstones of the lobby, four stories beneath.

It is needless to say that there was great anger and consternation in the breast of the worthy host of the *Red Indian* when, next morning, he awoke and found that his cherished statue had mysteriously disappeared. It was not long, however, before he obtained a clue to its whereabouts, as a customer informed him that late the previous night he 'met a lot of military claps carrying summut' in the direction of the barracks. This 'summut' Mr Slade shrewdly conjectured was his 'Red Indian'; and he at once wrote to the regimental quarters to make inquiries into the matter.

When the poor landlord discovered the gladiator in its fragmentary state, he became most angry and abusive; but was somewhat consoled when an emissary from the mess informed him that the officers would make good the damage, and requested him to inform them by letter next day the price at which he valued his statue. The

landlord then procured the services of a passing cart and had the pieces removed to the inn. After a long consultation with his wife, he decided to assess the damage, at ten guineas; and by way of making the most of the business, communicated with a marine store-dealer in town, intending to sell the smashed gladiator as old metal.

The colonel made the most strenuous though unavailing efforts to discover the practical jokers, and roundly abused the whole of the mess for their treatment of poor Mike; but after a while, the affair passed off in a general laugh.

Affairs, however, were speedily fated to take a turn which caused the implicated parties to laugh the other way. A large vessel arrived in the port of Chubleigh from Alexandria, which had among her passengers a celebrated London virtuoso, who, some months before, had been induced to pay a visit to Egypt by reason of the excitement produced in antiquarian circles by the discoveries of the celebrated Belzoni. This gentleman was posting to London when his chaise broke down opposite the *Red Indian*, and he entered the hostelry while the vehicle was being repaired. After partaking of a little refreshment, he took a walk in the garden, and his eye caught the fragments of the gladiator, which had been shot in a corner while waiting the arrival of the marine store-dealer's cart. Having elicited the story of the statue from the host, the antiquary submitted the pieces to a most careful examination; and despite the whitewash and coats of paint with which the figure had been adorned, he recognised it as a specimen of the work of the renowned ancient Greek sculptor Lysippus; and in answer to the excited inquiry of the astonished landlord, appraised its value at six hundred pounds!

Having, at the host's urgent request, given a written opinion on the matter, the virtuoso departed on his journey, and then Mr Slade hurried with his certificate to a Chubleigh attorney, in whose hands he placed the matter, with instructions to leave no stone unturned to recover the full amount from the officers.

Words could scarcely express the chagrin of the purloiners of the gladiator, when the colonel of the 31st Light Dragoons read at mess the contents of the letter he received from the legal adviser of the landlord of the *Red Indian*. The commanding officer further significantly hinted that the implicated parties would have to uphold their reputation as officers and gentlemen by paying the amount demanded, or run the risk of being cashiered.

At first, the jokers were inclined to dispute the claim, and invited the opinion of an expert; but that authority, when he had inspected the figure, corroborated the London man's decision, with a further assurance that the statue was cheap at the money.

Cornet Macnamara, with reasonable show of justification, stoutly declined to pay a farthing of the six hundred pounds. It was, however, with a very bad grace, indeed, that the sum was subscribed by the interested parties; and served as a valuable lesson to them to modify for the future their spirit of mischief.

When Mike discovered the identity of his tormentors, he sent a challenge to each, and an

arrangement was come to by which a representative was selected by ballot to meet the Irishman. This old trick of leadless pistols was resorted to; the combatants fired three shots at each other without any perceptible result, and then the seconds interfered, and declared honour satisfied.

A Jew purchased the fragments of the gladiator from the officers for a few guineas; but the wily Israelite well knew that a genuine Lysippus is almost as valuable broken as whole. He had the pieces skilfully rejoined, and disposed of the statue to a local virtuoso for a large sum, who in turn bequeathed it to the Chubleigh Museum.

With part of the money the lucky landlord of the *Red Indian* received for his gladiator, he invested in a wooden figure, which did duty for a sign equally well, and which he placed above the porch out of the reach of predatory officers, and where, as has been mentioned, it still stands, battered, cracked, and mouldy.

Shortly after the episode of the gladiator, the 31st Light Dragoons were hurriedly despatched to Lancashire, in order to quell the bread riots which had broken out in that county; and the actors in the comedy just narrated were heard of no more by the good folks of Chubleigh.

A little more remains to be told of the statue by Lysippus. We must come down to 1851, the year in which the Great Exhibition was held in Hyde Park. A middle-aged Frenchman landed at Chubleigh from Havre on his way to London, and while taking a walk about the town, entered the *Red Indian*. The landlord, who had profited so handsomely by his statue, had years before gone to his rest, and his son the ex-boatwain, then an aged man, reigned in his stead. The Frenchman was interested in learning that his host had taken a share in the old war, and after a time, he had narrated to him the whole history of the statue.

'Vat vas de name of de vessel you took?' he eagerly asked.

'The *Hercules*, sir.'

To the landlord's astonishment, Monsieur leant back in his chair and indulged in a fit of uncontrollable laughter, and recovering himself, asked to be directed to the Museum. Having reached that establishment, he was not long in picking out the Lysippus, of which he learned in Chubleigh were so proud. The Frenchman put on his glasses and examined the gladiator's toe-nail, and then gave vent to another guffaw, which speedily brought round him the officials of the establishment. He asked to see the secretary; and when introduced to the presence of that functionary, exclaimed: 'Begar, sir, dat gladiateur is no more a Lysippus dan I am de Czar Nicholas of all de Russias. My uncle, whd die ven I vas a leetle boy, keep vat you call a foundree in Athens, and have casts, or *replias* you call dem, made of all de antiqués. He den put dem down a sewer until dey get a green magnifique; dey look liks de real article; and he make heaps of money by selling dem as such in Paris. Your gladiateur is one of dem!'

'But, my dear sir,' asked the astounded secretary, 'how are you going to substantiate your statement?'

'Come wit me,' said the Frenchman; and the

twain proceeded to the statue. 'My uncle,' resumed the Frenchman, 'deal in de antique, as I have told you; and in case ha himself be cheated wit his own spurious statues, he have a private mark. Here is dis mark—a leetle hole drilled under dis toe-nail!'

The secretary communicated the purport of Monsieur's statement to the Museum directors; experts were called who substantiated the Frenchman's assertion that the work was spurious, and was no more the production of Lysippus than an Italian moulder's plaster-cast of Venus is the work of Phidias. In disgust, the directors ordered the statue to be transferred to the lumber-room of the establishment, and its description, 'Gladiator, by Lysippus, n.c. about 324; bequeathed by the late —, Esq., disappeared from the Museum catalogue.

ANOTHER 'SHIP-CANAL.'

Another has been proposed, although the idea is not new, but seems to have been an old idea revived, and that is, to cut a canal from the sea to Birkenhead Docks across the low flat country lying between the outfalls of the Dee and Mersey, and thus getting a wide passage which will enable ships to avoid the bar of the Mersey. Elaborate plans have been prepared by an eminent engineer; and as the whole scheme seems feasible, and as money for great schemes seems to be readily forthcoming in this wealth-producing country, there can be no reason why the 'ship-canal of Birkenhead' should not be carried out as well as the 'ship-canal of Manchester.' It would have a great and reviving effect on the town of Birkenhead, which by this means may one day become an important commercial city, a rival to, instead of a mere suburb of, her wealthy sister on the opposite Lancastrian shore; and the expectations of half a century ago of a grand city, with magnificent streets, and squares, and splendid commercial docks, may even yet be realised.

THIS IS ALL

Just a saunter in the twilight,
Just a whisper in the lull,
Just a sail on sea or river,
Just a dance at rout or ball,
Just a glance that hearts enthrall—
This is all—and this is all.

Just a few harsh words of doubting,
Just a silence proud and cold,
Just a spiteful breath of slander,
Just a wrong that is not told,
Just a word beyond recall—
This is all—and this is all.

Just a life robbed of its brightness,
Just a heart by sorrow filled,
Just a faith that trusts no longer,
Just a love by doubting chilled,
Just a few hot tears that fall—
This is all—ah! this is all.

SEALSKIN COATS, ALIVE AND DEAD.

THE ladies of England, who, living at home at ease, shield themselves from the inclemency of our not very rigorous winters in their elegant sealskin coats, think little, and know less, of the curious animal from which their beautiful garment is taken, and of the peculiar circumstances of its habitat and capture. Nor can their ignorance be deemed much of a reproach, seeing that until recently, even scientists were accustomed to regard the fur-seal as but a variety of the hair-seal, not unknown on the shores of Scotland, and abounding in the North and West Atlantic. But the two are quite dissimilar in their individuality and character, and as Mr H. W. Elliott, of the Smithsonian Institute of the United States—to whom we are chiefly indebted for the substance of this article—says, ‘the truth connected with the life of the fur-seal, as it herds in countless myriads on the islands of Aleutian Alaska, is far stranger than fiction.’ Mr Elliott spent three years in continuous observations on the spot, and is the first to afford us a complete and trustworthy view of the strange eventful history.

The fur-seal formerly abounded in the southern hemisphere on the borders of the Antarctic Circle; but reckless killing has well-nigh exterminated it there, and now, one may say that the only habitat of commercial importance is in that portion of the North Pacific which washes the Aleutian division of Alaska; and even here, the range is practically confined to four comparatively small islands. These islands were discovered by the Russian navigator Pribylov in 1786, and are still called by his name. They lie about two hundred miles due north of the group usually called the Aleutian Islands, off the western extremity of the Alaska peninsula. The Pribylov Islands rest in the very heart of Behring Sea, but far enough south to be free from permanent ice-flots, and thus to escape the ravages of the polar bear; while also far enough from the mainland and inhabited islands to be free from the attacks

of the primitive races. Thus the seals had collected and bred there for countless ages, undisturbed by beast or man, until the Russians first broke in upon their preserves. They have been the objects of constant attention and pursuit ever since.

There are three kinds of seals. The *Phoca vitulina* is the common hair-seal, which may often be seen on our north-western shores, while the fishing-vessels of Dundee, of Hull, of Peterhead, and of Greenock, go out to Greenland and Labrador to catch every season for the sake of the oil—the skin being of little value—and specimens of which, alive or stuffed, we may fairly assume every one of our readers has seen somewhere or other. There is probably not an aquarium of the country which has not a family of them. Then there is the *Eumetopias stelleri*, which the Russians call ‘Seevitchie,’ and which is known to our mariners as the ‘sea-lion.’ This and the walrus, which may be considered akin, are found in all the circumpolar regions. Lastly, there is the *Callorhinus ursinus*, called ‘Kantickie’ by the Russians, which is the true fur-seal, and which is the subject of our sketch. It has no generic affinity with the others, and is of quite different habits. As has been said, it is now found only on four islands of Behring Sea.

Of the fur-seal, it has been said that there is no known animal on land or water which can take higher physical rank, or which exhibits a higher order of instinct, closely approaching human intelligence. The male fur-seal is in his full prime at six or seven years of age, and will then measure from six and a half to seven and a half feet from snout to tail. He will weigh between four hundred and six hundred pounds—the latter weight, however, being found only in older animals, and not very frequently. He has a small head, with a muzzle and jaws not unlike both in size and form to those of a pure Newfoundland dog. The lips, however, are firm, and pressed together like those of man, and the large eyes of blue-gray are capable of expressing both soft and fierce emotions. On the

upper lip he has a long moustache of grayish bristles, which are often long enough to extend over his shoulder. He swims with his head high over the water, and on land walks with an undulating carriage and head erect. If frightened, he will run as fast as a man, but not very far—thirty or forty yards sufficing to exhaust his wind. The hind-feet are longer than the fore-feet or flippers, and in shape are very like the human foot elongated to twenty inches or so, and with the instep flattened. There are three toes on the hind-feet; but the fore-flippers are fingerless hands some eight or ten inches broad.

The female fur-seal is from four to four and a half feet in length from snout to tail, lithe in form, without the heavy covering of fat round the shoulders which the male has, and with beautiful, gentle, intelligent, dark-blue eyes. She will weigh from fifty to a hundred pounds, according to her condition. Her manners are as amiable as her eyes, and she never fights with her neighbours, as her quarrelsome lord and master does. The cow-seal has but one voice—a sort of bleating half-way between the cry of a calf and that of an old sheep—and this is used for calling the young, which, curiously enough, are known as 'pups,' although the mothers are 'cows,' and the fathers 'bulls.' The male seal, however, has four voices. One is for battle, and resembles the puffing of a labouring locomotive; another is a hoarse loud roar; a third is a sort of low gurgle or growl; and a fourth, a sort of chuckle, half-hiss, half-whistle. The breeding-grounds are called 'rookeries,' and there, during the season, the din of roars, puffs, growls, and whistles from countless thousands of vigorous 'bulls,' is ceaseless, and in volume has been compared to the boom of Niagara.

It is odd that the breeding-place of 'bulls' and 'cows' should be called 'rookeries,' but so it is. The first to arrive at these rookeries are the bull-seals, and the season begins about the first of May. As it is 'First come, first served,' and as there is an unwritten law among them that a bull requires a clear space of from six to eight feet square for the accommodation of himself and family, there is much scrambling and fighting for plots, and the late arrivals may be driven away without being allowed a landing-place at all. They fight with great strength and courage—only the adult males, however—running at each other with averted heads, and then seizing each other with their teeth. The battles are often long, and the wounds severe; but these soon heal; and an adventurous 'bull' thinks nothing of forty or fifty desperate combats in a season. While fighting, they utter both their roar and their whistle, the hair is sent flying in all directions, and the eyes gleam with angry fire. It is said that in a seal-fight there is always an offensive and a defensive party, and that if the latter is beaten, he simply vacates his position to the victor,

who does not follow his foe, but lies down on the conquered territory and gives vent to his chuckle.

Although the cows are amiable, they are not particularly demonstrative to their infants, which are born immediately after the females are located in the rookeries. Twins are very rare, and mothers always suckle their own young. The pups do not know their own mothers, and if separated from them, will take with the greatest alacrity to the first kindly cow which will console them with her rich creamy and abundant milk. The pups, for the first three months after birth, are jet black in colour, and bleat in a minor key after the fashion of the cows. At birth, a pup will weigh three or four pounds, and measure twelve or fourteen inches in length. Curiously enough, the pup-seal cannot swim, and even if he is several weeks old, will helplessly sink, if thrown into the water. But about the second week of August begins one of the most curious episodes of seal-life—the education of the young. By the time he has counted six weeks or so of life, the pup-seal begins to feel an inclination to play on the margin of the sea, where, as the waves flow and recede, the shore is alternately covered and uncovered. The baby-seal finds that thousands and thousands and tens of thousands of his fellow-babies have been smitten with the same curiosity about the sea almost simultaneously with himself, and that the beach is swarming with tumbling, floundering, gurgling, whistling, playful, yet nervous young animals. By-and-by, one plucks up courage to try a plunge in the deeper surf; others follow; one gets carried beyond his depth, and in frantic struggles to reach the shore again, discovers that he has a power of locomotion even in the water. It is but feeble; and when a kindly wave checks him out of harm's way on to the rocks, he is blown and exhausted. But he takes a short sleep, and then has another go; and after a few more efforts, finds, to his great delight, that he is even more at home in the water than on the land. For the next few weeks the coast-waters of the islands are black with the little fat bodies revelling in their new-found power, and gamboling among the breakers like children on the grass. It used to be believed by the old sailors that the parent seals drove their young ones into the water and taught them forcibly to swim; but more recent and careful observation places it beyond doubt that the parents take no part whatever in the process of education, but leave the young ones to learn the battle of life for themselves.

By the time the breeding season is over, all the young seals have become able-bodied swimmers. By this time, too, the pups have grown to thirty or forty pounds-weight, and have changed the black coat of infancy for the thick, gray, hairy coat of youth. At this age, the coats of both male and female are similar; indeed, not until the third year do they assume their permanent differences. The outer coat of the full-grown bull is of a dark-brown colour, and the hairs are short and crisp; beneath, like the down under the feathers of a bird, is the close, soft, elastic fur, so esteemed by man, or rather woman. The full-grown cows, as they come into the rookeries at the beginning

of the season, are of a dull, dirty-gray colour, which, after they have been a short time on land, changes to a rich steely gray on the back, and snow-white on the chest and belly; but after a few weeks the white changes into a dull ruddy colour, and the steel gray into a brownish gray. The breeding season is over by the end of July; the families begin to break up, and the rookeries to be disorganised during August. By the middle of September, all order and distinction is lost, and the young ones have commenced life on their own account. By the end of October, all the mature seals have left the islands; and by the end of November, even the youngest have disappeared.

Whither? That is one of the conundrums of nature, as is also the question, where do the seals die? It is certain that none perish from natural causes on the islands, and all that is known of their doings elsewhere is, that they seem usually to shape a southern course. They are lost in the vast mazes of the Pacific, not to be seen of man again until the following summer. They have natural enemies in sharks and other submarine animals of prey; but it is not thought that their numbers suffer much diminution on this account. Their own food is fish, and Mr Elliott has calculated that an adult male seal will consume forty pounds, and an adult female ten to twelve pounds, per day, of fresh fish. Taking, with the young ones, an average of ten pounds per day each, and the numbers annually frequenting the rookeries of the Pribylov Islands—which have been ascertained by careful measurement and estimate at about four millions and three-quarters—we have a total of six millions of tons of fish consumed every year by the fur-seals! The figures are stupendous, but they seem beyond doubt.

As to the now approximately known number of seals, there is no reason to believe that it is any greater than it was when the islands were first discovered; and while the number will not be decreased by the present method of capture, it is not thought that it will increase. The supply of fur-seals, then, may be taken as a fixed quantity, with a known annual yield to man. That yield is restricted by the law of the United States to one hundred thousand skins per annum. The government holds the islands for the State and leases the right of capture to a Company, who are permitted not to take a larger number than that just mentioned. They employ the natives of the Aleutian Islands, who work in gangs, under their chiefs, and receive forty cents, or one shilling and eightpence, for every 'pelt' or hide they hand to the Company's officials. Government officers, again, keep a separate tally; so there is a double check upon the Company, who cannot easily, even if they wish, exceed their prescribed rights. As the annual birth-rate is about one million, of which one half are males, the number annually abstracted by man can have no appreciable effect in reducing the supply or in affecting the natural increase. The average natural life of the male seal is believed to be from fifteen to twenty years, and that of the female, about ten years, so that deaths by man on the rookeries, and from submarine foes during the winter, suffice to keep the race within the bounds now known.

The men operate only on the haunts of the 'bachelor' seals. It is presumed that about two-

thirds of the males are not allowed to land on the rookeries by the stronger and abler remnant, so that the wants of man can be supplied without interfering with the operations of the breeding-grounds. When the 'bachelors' are dozing about the shores in the early summer, the natives get in quietly between them and the sea. The seals on perceiving the men turn to run inland, and are easily driven to the appointed killing-grounds. Three or four men can easily guide and secure as many thousand seals, and the drying is done leisurely, for if the animals become overheated, the fur is injured. The men therefore allow them to rest from time to time, and renew the drive by clattering and shouting, to startle the seals to fresh exertions. They move with the docility of a flock of sheep, and only the old hulls ever show fight. These last will occasionally make a stand and act on the defensive; but as they are of little value commercially, the bellicose oldsters are allowed to drop out and go their own ways. It is only the animals between one and five years old which are desired, for after the fifth year, the fur deteriorates, the undergrowth becoming shorter and coarser. The thickest and finest pelts are those of the third and fourth years. Beneath the skin is a dense layer of oily blubber, which, unlike the blubber of the hair-seal, has a very offensive odour.

The work of catching and pickling the pelts occupies June and July, by which time the Company will have secured its legal number of one hundred thousand, or as many short of the number as circumstances have confined them to. After July, the seals begin to moult, and the skins become of less and less value as the season advances. Altogether, three hundred and ninety-eight persons are employed annually on the Pribylov Islands in this work.

After the 'catch' is ended, the skins are taken in the Company's steamers to San Francisco, and thence nearly all or about nine-tenths are shipped to London, for London has the monopoly of the preparation of these furs for market. The skins as they come into England are very different in appearance from what we see on the backs of our lady-friends. They are indeed very unattractive; and all the coarse stiff outer hair has to be carefully extracted before the rich under-fur is seen. This last is then dyed and dressed. It is hurried or defective dyeing and dressing which accounts for the variation in prices of the finished furs, for there is little difference in the original quality. The more careful and skilful the work of the furrier, therefore, the dearer becomes the sealskin jacket.

The Alaska Commercial Company's lease of the islands is for twenty years from the 1st of May 1870, and they pay the government a rental of eleven thousand pounds per annum for the islands, and a tax of eight shillings for each sealskin, ten and sixpence for each fur-seal skin, and fifty-five cents for every gallon of oil, shipped. The Company is also bound to supply the inhabitants with a stipulated quantity of dried fish, firewood, and salt; to maintain a school on each island for the education of the natives; and not to sell or give any 'distilled spirituous liquors' to the natives. We believe that the Company has in only one year (1881) taken its full number of skins, the usual number shipped being from ninety

to ninety-five thousand. Between 1870 and 1881, the Company had paid the United States Treasury nearly three and a half millions of dollars in rent and royalty.

BY ORDER OF THE LEAGUE.

CHAPTER XVI.

CONSUMED by conflicting emotions, and torn by a thousand hopes and fears, Maxwell set out on his journey to Rome. At any hazards, he was determined to commit no crime, and trusted to time and his own native wit to show him a way out of the awful difficulty, which lay before him. All the old familiar country he passed through failed to interest him now; he saw nothing but his own fate before his eyes; and the Eternal City, which had once been a place of mystery and delight to him, now looked to his distorted fancy like a tomb, every broken statue an avenging finger, and every fractured column a solemn warning.

It was night when he arrived and secured apartments—the old ones he had occupied in his student days, the happiest time in his life, he thought now, as every ornament recalled this silent voice or that forgotten memory lumbering in some corner of his brain. He could eat nothing; the very air of the place was oppressive to him; so he put on his hat and walked out into the streets, all alive with the citizens taking their evening walk, and gay with light laughter over flirtations and cigarette smoke. He wandered long and far, so far, that it was late when he returned; and there, lying on the table, was a sealed packet, bearing the device of the Order, and in the corner two crossed daggers. He groined as he opened it, knowing full well the packet contained the hated 'instructions,' as they were called. He tore them open, read them hastily, and then looked out of the window up to the silent stars. And it was Visci, his old friend Carlo Visci, he was sent here—to murder! The whole thing seemed like a ghastly dream. Visci, the truest-hearted friend man ever had; Visci, the handsome genius, whose purse was ever ready for a fellow-creature in need; the man who had sat at his table times out of number; the student who was in his secrets; the man who had saved his life, snatched him from the very jaws of death—from the yellow waters of the Tiber. And this was the friend he was going to stab in the back some dark night! A party of noisy, light-hearted students passed down the street, some English voices amongst them, coming vaguely to Maxwell's ears, as he sat there looking on the fatal documents, staring him in the face from the table.

'Et tu, Brute!'

Maxwell looked up swiftly. And there, with one trembling forefinger pointing to the open documents, stood the figure of a man with a look of infinite sorrow on his face, as he gazed mournfully down upon the table. He was young—not more than thirty, perhaps, and his aquiline features bore the marks of much physical suffering. There were something like tears in his eyes now.

'Carlo! is it possible it is you?' Maxwell cried, springing to his feet.

'Yes, Fred, it is I, Carlo Visci, who stand before you. We are well met, old friend; you have not far to seek to do your bidding now. Strike! while I look the other way, for it is your task, I know.'

'As there is a heaven above us, no!' Maxwell faltered. 'Never, my friend! Do you think I would have come for this? Listen to me, Visci. You evidently know why I am here; but—sure as I am a man, never shall my hand be the one to do you hurt. I have sworn it!'

'I had expected something like this,' Visci replied mournfully. 'Yes, I know why you came. You had best comply with my request. It would be a kindness to me to kill me, as I stand here now.'

'Visci, I swear to you that when I joined the Brotherhood, I was in the blackest ignorance of its secret workings. When I was chosen for this mission, I did not even comprehend what I had to do. Then they told me Visci was a traitor. Even then, I did not know it was you. Standing there in the room, I swore never to harm a hair of your head; and, heaven help me, I never will!'

'Yes, I am a traitor, like you,' Visci smiled mournfully. 'Like you, I was deceived by clap-trap talk of liberty and freedom; like you, I was allotted to take vengeance on a traitor; and like you, I refused. Better the secret dagger than the crime of fratricide upon one's soul!'

'Fratricide! I do not understand.'

'I do not understand either. Frederick, the man I was detailed to murder—for it is nothing else—is my only brother.—You start! But the League does not countenance relationships. Flesh and blood and such paltry ties are nothing to the friends of liberty, who are at heart the sternest tyrants that ever the mouth of man execrated.—But what brings you here? You can have only one object in coming here. I have told you before it would be a kindness to end my existence.'

'But why? And yet, when I come to look at you again, you have changed.'

'I have changed,' Visci echoed mournfully—'changed in mind and body. My heart is affected, diseased beyond all hope of remedy. I may die now, at any moment; I cannot live four months.'

They sat down together, and fell to discussing old times when they were happy careless students together, and Maxwell did not fail to notice the painful breathing and quick gasping spasms of his friend, altered almost beyond recognition from the gallant Visci of other days.

'Salvarini advised me to come here. You remember him; he claims to be a true friend of yours,' Maxwell observed at length. 'He said it would gain time, and enable me to form my plans.—But tell me how you knew I was in Rome. I have only just arrived.'

'I had a sure warning. It came from the hand of Isodore herself.'

'I have heard much of her; she seems all-powerful. But I thought she was too stern a Leaguer to give you such friendly counsel. Have you ever seen her? I hear she is very beautiful.'

'Beautiful as the stars, I am told, and a noble-hearted woman too. She is a sort of Queen of

the League; but she uses her power well, ever erring on the side of mercy. She has a history, report says—the old story of a woman's trustfulness and a man's deceit. Poor Isodore! hers is no bed of roses!

'And she put you on your guard?' Maxwell asked. 'Come, there must be some good in a woman' like that, though I cannot say I altogether like your picture. I should like to see her.'

'I should not be surprised if you did before many days. She is the one to protect you from violence. With her sanction, you could laugh the mandates of the League to scorn. Had I long to live, I should sue for her protection, and wherever she may be, she would come to me. Even now, if she comes to Rome, see her if you can and lay your case before her.'

'And shield myself behind a woman! That does not sound like the chivalrous Visci of old. She is only a woman, after all.'

'One in a million,' Visci answered calmly. 'If she holds out her right hand to you, cling to it as a drowning desperate man does to a rock; it is your only chance of salvation.—And now it is late. I must go.'

Despite his own better sense, Maxwell began to dwell upon the fact of gaining assistance from the mysterious Isodore. At meetings of the League in London, he had heard her name mentioned, and always with the utmost reverence and affection. If she could not absolutely relieve him from his undertaking, she could at any rate shield him from non-compliance with the mandate. Full of these cheerful thoughts, he fell asleep.

He found his friend the following morning quite cheerful, but in the daylight the ravages of disease were painfully apparent. The dark rings under the eyes and the thin features bespoke nights of racking pain and broken rest.

Visci noticed this and smiled gently. 'Yes, I am changed,' he said. 'Sometimes, after a bad night, I hardly know myself. It is cruel, weary work lying awake hour after hour fighting with the grim King. But I have been singularly free from pain lately, and I am looking much better than I have been.'

'There might be a chance yet,' Maxwell replied with a cheerfulness wholly assumed, and thinking that this 'looking better' was the nearest approach to death he had ever seen. 'An absence from Rome, a change of climate, has done wonders for people before now.'

Visci shook his head. 'Not when the main-spring of life is broken,' he said: 'no human ingenuity, no miracle of surgery can mend that. Maxwell, if they had deferred their vengeance long, they would have been too late. Some inward monitor tells me I shall fail them yet.'

'You will for me, Visci, you may depend upon that. Time is no object to me.'

'And if I should die and disappoint you of your revenge, how mad you would be!' Visci laughed. 'It is a dreadful tragedy to me; it is a very serious thing for you; and yet there is a comic side to it, as there is in all things. Ah me! I cannot see the droll side of life as I used; but when the bloodthirsty murderer sits down with his victim tête-à-tête, discussing the crime, there is something laughable in it after all.'

'I daresay there is,' Maxwell answered grimly, 'though I am dense enough not to notice it. To me, there is something horribly, repulsively tragic about it, even to hear you discussing death in that light way.'

'Familiarity breeds contempt. Is not that one of your English proverbs?' Visci said airily. 'But, my good Frederick,' he continued, lowering his voice to a solemn key, 'the white horseman will not find me unprepared, when he steals upon me, as he might at any moment. I am ready. I do not make a parade of my religion, but I have tried to do what is right and honest and honourable. I have faced death so often, that I treat him lightly at times. But never fear that when he comes to me for the last time.'

Maxwell pressed his friend's hand in silent sympathy. 'You always were a good fellow, Visci,' he said; 'and if this hour must come so speedily, tell me is there anything I can do for you when—when—'

'I am dead? No reason to hesitate over the word. No, Maxwell; my house is in order. I have no friends besides my brother; and he, I hope, is far beyond the vengeance of the League now.'

'Then there is nothing I can do for you in any way?'

'No, I think not. But you are my principal care now; your life is far more important than mine. I have written to Isodore, laying a statement of all the facts before her; and if she is the woman I take her for, she is sure to lose no time in getting here. Once under her protection, you are safe; there will be no further cause for alarm.'

'But it seems rather unmanly,' Maxwell urged. 'Unmanly!' echoed Visci scornfully. 'What has manliness to do with fighting cowardly *vendetti* in the dark? You must, you shall do it!' he continued vehemently; but the exertion was too much for him, and he swayed forward over the table as if he would fall. Presently, a little colour crept into the pallid face, and he continued: 'You see, even that is too much for me. Maxwell, if you contradict me and get me angry, my blood will be upon your head after all. Now, do listen to reason.'

'If my want of common-sense hurts you as much as that, certainly. But I do not see how this mysterious princess can help me.'

'Listen to me,' Visci said solemnly. Then he laid all his schemes before the other—his elaborate plans for his friend's safety, designs whose pure sacrifice of self were absolutely touching.

Maxwell began to take heart again. 'You are very good,' he said gratefully, 'to take all this infinite pains for me.'

'In a like strait you would do the same for me, Fred.'

'Yes,' Maxwell answered simply. 'How Salvini's words come back to me now! Do you remember, when I wanted to throw my insignia out of the window that evening, the last we all spent together?'

'I recollect. It was two days before little Genevieve disappeared,' Visci answered sadly. 'Do you know, I have never discovered any trace of her or Lucrece. Poor child, poor little girl! I wonder where she is now.'

'Perhaps you may see her again some day.'

'It has long been my dearest wish; but it will never be fulfilled now. If ever you do see her once more, say that I'—

'Visci!'

As the last words fell from the Italian's lips, his head hung forward, and he fell from his chair. For a moment he lay motionless, then raised his face slightly and smiled. A thin stream of blood trickled down his fair beard, staining it scarlet. He lay quietly on Maxwell's shoulder.

'Do not be alarmed,' he said faintly. 'It has come at last.—There are tears in your eyes, Fred. Do not weep for me. Do not forget Carlo Visci, when you see old friends; and when you meet little Genevieve, tell her I forgave her, and to the last loved and grieved for her.—Good-bye, old friend. Take hold of my hand. Let me look in your honest face once more. It is not hard to die, Fred. Tell them that my last words—*Jesu, mercy!*'

'Speak to me, Carlo—speak to me!'

Never again on this side of the grave. And so the noble-hearted Italian died; and on the third day they buried him in a simple grave under the murmuring pines.

No call to remain longer now. One last solitary evening ramble, Maxwell took outside the city wall ere his departure. As he walked along wrapped in his own sad thoughts, he did not heed that his footsteps were being dogged. Then with a sudden instinct of danger, he turned round. The feet that followed stopped. 'Who is there?' he cried.

A muffled figure came towards him, and another stealthily from behind. A crash, a blow, a fierce struggle for a moment, a man's cry for help borne idly on the breeze, a mist rising before the eyes, a thousand stars dancing and tumbling, then deep, sleepy unconsciousness.

(To be concluded next month.)

THE PLEASURES OF RUIN.

THERE must be many people to whom the above heading will be at once suggestive of the famous chapter upon Snakes in Iceland; but to the philosophical mind—and it is marvellous how philosophical one can become under adversity—there are certain compensating advantages in the state of ruin, which, if not quite so intense as the Pleasures of Hope, or Memory, or Imagination, do much to reconcile us to the change in our circumstances. The first feeling is one of extreme relief that the whole thing is over and we are out of suspense. The spasm has come; writs and summonses have blossomed into sheriffs' officers, and the auctioneer, whose fell and inexorable hammer has made short work of our goods and chattels; our wealthy friends have said that they knew it would come to this; and Jones, who used to look dinners and five-pound notes at us whenever he met us formerly, now crosses over to the opposite side of the street. The cheap lodgings in the shady neighbourhood have become hard and ineradicable facts, and we can look about us at last and endeavour to make the best we can of the position.

You now have a newly acquired sense of freedom and independence to which perhaps you have long been a stranger. It is no longer a

question of whether you shall dine at the *Bristol* or the *Blue Posts*, but in all likelihood the choice will lie between the *dinner du jour* in Leicester Square, a chop, or Duke Humphrey. Nor, if you be a married man, need you now vex your soul with the proper precedence of a brigadier-general, an Indian judge, a colonial bishop, and a resident commissioner from the Punjab, as has happened in the days gone by when you gave a dinner. Nor will the varying merits of asparagus soup and turtle, salmon mayonnaise and aspic of lobster, truffled turkey and oyster-stuffed capon, and all the rest of it, come between you and your night's rest. Again, your circumstances are such that you are no longer harassed by the touters for subscriptions, male and female, and you find it therefore needless to discuss the comparative merits of the claims put forward by the friends of the Cannibal Islanders for French mustard, and by the friends of the Mayor of Little Pedlington for a new pump in the market-place in honour of that excellent cheesemonger and municipal chief.

When you go to the theatre or opera, you are no longer compelled to pay fifty or a hundred per cent. for the privilege of receiving your ticket from an agent, and you go to the pit, where, if the orange peel and ginger beer and nuts are a bit of a nuisance at first, you are not long in getting used to it; and at any rate you are permitted to hear the piece without being bored by one of Smith's 'good stories' during Patti's chief *aria*, or while living is giving some fine piece of declamation. You discover sources of gratuitous amusement which indifference has hitherto hidden from you. That glorious rotunda in Bloomsbury, the British Museum Reading-room—the mausoleum of the mind of the world—gives you opportunities for study and recreation of which you have never before thought of availing yourself; and the treasures of South Kensington and the National Gallery, which you have hitherto neglected as 'slow' and 'bad form,' are now a source of delight to you. The only fault that you can now find with the latter institution is, that it spoils you for all the modern galleries about Pall Mall and Piccadilly. You have a feeling of proprietorship now in the royal parks, which you never had when you sauntered in the Row, or attended the meet of the Coaching Club at the Magazine, or dawdled about the Mall in St James's Park on a Drawing-room day. You don't attend these 'functions' now, for, though they are open to you as to the rest of the world, you feel yourself rather out of the race. But you often enjoy the air in the higher ground of Hyde Park, which you will come to consider as bracing as the Sussex Downs; nor are you to be persuaded that Burnham Beeches has a much finer show of trees than Kensington Gardens.

But the time when you do really and thoroughly enjoy the Pleasures of Ruin is when that delectable moment comes—which it inevitably will, sooner or later—when a temporary, or, let us hope, it may be a permanent, change in your fortunes takes place. Your book has found a publisher; your picture a buyer; some one pays up an old debt; or an unknown relative mentions your name in his will. Whatever it may be, the keen appreciation of the

benefits we formerly enjoyed which our vicissitudes have taught us, and the knowledge we have acquired of the dingier side of nature, give a remarkable zest to our return to a brighter life. And if a man has good health and good spirits, he will find that it is as true that 'hope springs eternal in the human breast,' as that when things are at their worst they mend; and if he is of an extra-hopeful disposition, he will welcome the increased depression of his fortunes as a sure forerunner of a change of luck.

COUSIN GEORGE.

IN TWO CHAPTERS.—CHAP. II.

ALL went well in the Smethby circle, indeed things had never before gone so smoothly in that not unprosperous group. Harriet, it is true, did not get more manageable in the Robert Crewe direction; she was perfectly ready to flatter and please the Australian cousin, and had an eye to the main chance as keen as others; but the young doctor was not to be jeopardised. Thus Harriet might be regarded as an exception; so, of course, might Mr Crewe; but after all, as he does not actually appear in our narrative, he need not count for much.

There were frequent indications that the ridiculous disguise, the absurd plea of poverty, at first put forth by Styles was being gradually discarded—was 'peeling off'; Mr Joe said, with a happy touch of description. But Mr Smethby would not see all these indications—pretended not to notice any flaws; he would humour his cousin just as long as the latter chose.

The proposed investment was still in favour, was about to be made, indeed; and so earnest was Cousin George in the matter, that when Smethby said he had given notice at the bank for his money, he confidentially told him that if there was any difficulty about getting it, his friend would advance the sum for a week or two—or for a year, if Smethby would like it. The latter thanked him, but declined. Of course he could see through this, as he had seen through the other flimsy screens.

The bank was good enough, he explained, and so it was, for the money was duly paid to him; and it was proposed that they should go up to town together, Smethby and Cousin George, where the latter would see his friend's broker and arrange for the purchase of this stock.

In a confiding mood, not usual with him, Smethby had proposed that Styles should send a cheque up, or go up with it by himself, if going up were necessary; but the latter declined to do this. He seemed to have a strange dislike to cheques or drafts, and as he said: 'It was not their way at the diggings; a man liked to look after his own business there.' So Cousin Nick must go with him.

He, Cousin George, had also asked Harriet what kind of bracelet she preferred; for his friend had desired him to consult some lady's taste, as he, the friend, was thinking of making a little present. Harriet was not proof against this temptation, so explained that amethyst bracelets with amethyst pendants—or sapphire and diamonds, if she *did* have her choice—was what she liked. Cousin George, with a highly expres-

sive wink on hearing this, said his friend would be much obliged by her opinion. He should perhaps see him on the next day but one when he, Styles, and her father went to London.

'All which means, my dear,' said Smethby, when he had a chance of whispering to his daughter, 'that this farce is about to end. He means to present me with the whole of these twenty thousand shares, and you will have a present also. Beyond this, you will have an offer in plain language—his language has already been plain enough to show what he means; so, be a sensible girl, and don't lose a chance the like of which will not occur again, if you live for a hundred years.'

Harriet did not reply; there was indeed a recurrence of the pouting and frowning; she could not resist the jewelry; but when Robert Crewe was endangered, she exhibited some of the old perversenesses.

In the morning, Cousin George took a stroll into the town, as was his habit. Smethby knew quite well that his eccentric relative went to the post-office, whither his letters, as every one knew, were directed. No one, however, pretended to suspect anything like this arrangement, which was just as shallow and easily penetrated as his other schemes. On his return, he was in higher spirits than usual; a little fiffal, perhaps, but certainly more jocular and fuller of sly allusions than he had hitherto allowed himself to be. This was evidence enough, to such a man as Smethby, to show that the end of the scheme was approaching. He broached a capital joke—he undoubtedly so considered it—in the way of a question as to what his cousin Nick would have thought of and said to him, Styles, if he had come back from the diggings loaded with shiners—'Not one or two, Nick, but some scores of thousands, eh!—what then, Nick?' he exclaimed.

Smethby was of course acute enough to seize such a palpable chance, so replied with the utmost heartiness and frankness, that, delighted as he should have been at such good fortune, it never could have made any difference in his feelings to his old friend and cousin, George Styles. The latter grasped his hand at this, and seemed for the moment almost overcome by his feelings. He was indeed about to say something, which Smethby expected would prove a clearing-up avowal; but he checked himself, and saying abruptly, 'No; wait a day or two,' turned the conversation.

Yet, all through the day, there was an uneasiness in Cousin George's manner which could not escape the attention of those around him; and he took several short strolls in the open air to soothe his nerves, which, he admitted, seemed rather shaky. On the last occasion that he took his saunter, it was in the twilight, and in the glance which he naturally throw around him before entering the house, he could see, standing in relief against the clear summer sky, the figures of two men, who were apparently conversing earnestly as they paced on a knoll not far from Mr Smethby's residence.

Then Styles went in, and found the lamps were just lighted, the curtains were drawn, while his host and his daughter, evidently in the best of moods, were awaiting him. With a decision

which was almost like abruptness, Styles began about the visit to London on the morrow. He explained, as he had done before, that until the transaction was completed, he did not want any one, not even the broker, to know that the stock was not entirely for his friend, who had promised to take over all the disposable shares; and that was why he had asked Mr Smethby to provide money instead of a cheque for the payment.

'I understand,' smiled Smethby; 'and, as you know, I have arranged to get notes in the morning. But here is the cheque, if that would suit you—you can have it to-night, if you like.'

'No; O no!' returned Styles; but the response came so slowly, that it seemed as if he had hesitated before deciding. 'There will be no use in that; so long as I can see the broker alone, that will do.'

'Just as you please,' said Mr Smethby. As he paused, a ring at the street door was heard.

'And now a word or two about that little villa my friend thought of buying at Richmond,' resumed Styles. 'I had a letter this morning.'—

'If you please, sir,' said the maid-servant, appearing at the door, 'a gentleman wishes to see you.'

'To see me, or to see Mr Styles?' asked her master. Another ring was heard at the street door as he said this.

'I believe I want to see both of you,' said a voice behind the servant, which voice being deep and harsh in its tone, and coming so unexpectedly, made each person in the room start; 'so I shall take the liberty of coming in here,' continued 'the gentleman'; then, suiting the action to the word, he pushed past the attendant, and came close to the table which filled the centre of the room.

All looked at him in amazement; while, before any one spoke, Mr Joe and Mr Brooks, who had called just then to have a chat with Mr Styles, also entered, and gazed at the stranger with as much astonishment as was shown by their friends. The stranger was an elderly, grizzled, but powerfully built man, with hard features, high cheek-bones, indented nose, square jaws, hidden by his stiff iron-gray beard, and moustache.

'You are Mr Smethby—Nicholas Smethby, I believe: in fact, I know it,' said the man.—'But may I ask who this is?' pointing to Cousin George as he spoke.

'I really do not know what your business here is, or why you make this inquiry,' returned Smethby, a good deal nettled by the intrusion; 'but I certainly am Nicholas Smethby, and this gentleman is Mr George Styles. Have you any business with either of us?'

'Did you ever see George Styles look like a cross between a skittle-sharp and a stage smuggler?' continued the visitor, 'which is what this fellow looks like.'

'Do you mean?'—began Cousin George, but he spoke falteringly; while Mr Joe and Mr Brooks, who stood behind the stranger, could see that the speaker turned pale.

'Yes; I do mean,' interrupted the visitor;

'and I mean a good deal more than that, as you will find.' He flourished an ugly-looking stick which he carried, as if to give emphasis to these words.—'As for you, Nick Smethby, I am surprised and ashamed to think you could be such a fool as to mistake a fellow like this for your own cousin—for me!'

Here every hearer started in reality; and Smethby, drawing a long breath, looked from one to the other with an expression which clearly showed that he did not mean to contest the announcement.

'Do you think,' resumed the new-comer, 'that a man, after twenty years' beating about the diggings, which I have had, could look as young as he did when he started? which is pretty nearly what this fellow does, in spite of his make-up.—I have come back with enough to pay you your loan, Nick, but I have been down very low in my time. I have fought two battles in the colonial ring, and I am going to show this fellow, presently, how I won them.'

'All this is dreadfully mysterious!' exclaimed Smethby; 'yet one thing is clear enough: I will swear you are my cousin George Styles. But then, who is this?—Yes, who are you, you impostor?' he cried, turning sharply upon his guest, who gasped once or twice, as though trying to speak, but was paralysed by the new-comer, from whom he could not remove his eyes.

'Don't trouble yourself about him yet,' pursued the second Styles. 'I will just say what I have to say, and then I will get it all out of him; you will see that. I fancy, however, I am only just in time. Is it true that you have agreed to go up to London with this person and invest a lot of money among his confederates?'

The 'first cousin,' as he may fairly be called, groaned at this; while Mr Smethby uttered, as well he might, an ejaculation of intense astonishment at finding his intentions and plans thus known to a man whom he had not seen for twenty years.

'I see you are surprised, Nick, and that our customer there feels he is bowled out,' said the stranger. 'But after all, there is nothing to wonder at in the matter. I inquired my way at the station—having learnt your address from your old office—and a gentleman who overheard me, kindly offered to show me the place. I told him who I was; and he was just as much as flabbergasted as you are; but he was delighted as well. He told me all about this'—The speaker paused while he cast a look of utter contempt at his predecessor, and then went on, evidently unable to find an epithet suitably strong. 'He told me he was a doctor, by name Robert Crewe.' (It was now Harriet's turn to start and change colour.) 'We walked together to a point just below here, where he turned off at the brow of a hill. He not only told me about the impostor who was taking my name, but pointed him out as he slunk in at the gate.' (The unlucky cousin remembered, and groaned audibly as he did so, the two men whom he had seen in converse on the rise in the road.) 'So here I am; and the first thing I mean to do is to collar this fellow, and thrash him until he has not a sound inch of skin on his carcase.—But don't you turn pale, my dear.' This was said to Harriet, and the speaker raised his cap with a sort of reassuring

politeness. 'Though I have come straight from the mines, I do not forget what is due to a lady; and I shall take the fellow outside to have his thrashing, and he shall have it now.' With this, he made a stride forward, and thrusting his huge hand inside the man's collar, clutched him with a grip which might have been of iron, and with a single tug pulled him to his feet; but the victim seemed unable to stand, and sank back on his chair all of a heap.

Harriet uttered a scream as the real Cousin George bent over the man, evidently intent upon dragging him out by main force; while Mr Joe and Mr Brooks seized his arm, and urged him not to be violent—Joe at the same moment briefly introducing himself and his brother-in-law.

'I am glad to see you again, anyhow, young Joe,' returned Styles. 'I remember buying you a drum the last time I was in your company.—But you had better let me settle this fellow at once.'

'Spare me!' whined the man. He could not speak comfortably with such a grip on his collar and with such knuckles buried in his neck.

'Why, what I am going to do is real mercy to you!' retorted his captor. 'You will be sore for a week or ten days, and then be as well as ever; but if I give you over to the police—Well, as you seem to dread a simple licking so much, we will go to the police. Come on!'

Another tremendous tug here dragged up the unfortunate creature, who broke into most despairing petitions, imploring that they would not give him up to the police—they knew him, he said.

'Why, confound it! you do not suppose you are to be let off scot-free, after such a game as this, do you?' exclaimed the other, whose astonishment was so clearly genuine, that Joe and Brooks could not repress a smile.

'I will confess everything; I throw myself on your mercy!' urged the man; 'but don't give me up to the police. I am sure to get it hot, if you do.'

'So you ought!' ejaculated Styles.

'I think if you were to quit your hold on his neck, he could speak freer,' said Mr Joe; 'and I should really like to know how all this came about.'

'Ah! so he might,' assented Styles, acting on the suggestion. 'I can easily catch hold of him again when I want him. I'll bet he does not give us the slip.'

In spite of the threat conveyed in the last speech, the culprit's face visibly brightened after Joe's remark. Mr Smethby had remained silent all this time, being not only confused with the unexpected revelation, but a little ashamed, possibly, of his own management, which was so over-cunning as to make him a readier prey to the swindler.

'Well, go on,' was the rough command of Styles. 'Who are you? Where do you come from?'

'My name is John Smith,' began the man. A furtive leer which he cast upon the company as he said this, might have been involuntary; but certain it is that none of those who saw it believed he was speaking the truth. 'I had got into trouble,' he continued, 'and wanted some money for a fresh start. While I was at my

wife's end to get this, a pal—a friend—who knew I had been in a difficulty, said' (he paused here, and glanced at Smethby)—'he said there was a flat to be had at Valeborough, if he was properly worked.—No offence, I hope, sir. It was not me who said this; it was my friend.'

'It was correct enough, whoever said it,' replied Smethby, to whom the remark had been addressed.

'He knew a lot about the family affairs here,' continued Smith: 'he had scraped about and picked the particulars up, till he thought he had got quite enough to enable a man to act as the cousin they had not seen for twenty years; but he owned he had not got the headpiece to keep the game up for any time; so I was to be the cousin; and he was to be a friend who knew me, and was to manage—as he did very well—to get hold of Mr Smethby, as if by accident, and tell him all about the good luck of his old friend Styles, and how he was going to try on a game with his cousin' Mr Smethby.'

'I never thought I was such an idiot; but go on,' said the host.

'We raked up some money between us,' resumed Smith; 'but it was a hard job to get enough, as of course I had to be pretty liberal; but luckily this gentleman would not let me spend much.—However, I got a letter this morning, saying that Ben—my friend—could not send another penny, and that unless I could make a haul at once, the thing must burst up. But the business was nearly ripe. I had prepared the way for persuading my cousin, as I called him, to invest a lot of money, by dropping a pretended letter from my stockbroker, which I knew they would find and read. In fact, there was no difficulty all through; and I had arranged for a visit to London to-morrow, so I was in hope that—'

'That you could make the haul,' said Smethby, as the other paused. 'How did you mean to do it, when I should be with you? I was to go to the office, you know.'

'I meant to take you to a place where you would wait in a room, while I went into what you would think was only an inner office, but which I knew had a way out,' answered Smith. 'In fact, if I had once touched the money, there would have been an end of it.'

'And your friend with the villa and the bracelets?' asked Smethby.

'All put in to make it seem more natural,' said the man. 'But I have not robbed your place of a pennyworth ever since I have been here, I assure you. I hope you will take that into consideration.'

He went on a little further, until he was interrupted by Styles, who led him to the door—no force was now wanted—and telling him that he would give him in charge to the nearest policeman if he ever saw him again, pitched him out on the dark road, and then returned to the circle he had left.

At first, Smethby was terribly chaffed, but recovered ere long, and joined in the laugh with which first 'Cousin George' and then the others reviewed the past. Harriet was not the noisiest of the party, but she was not the least happy, and 'Cousin George' appeared to have taken a great fancy for her.

Styles paid his debt to 'Nick Smethby' that night, to prove, as he said, that he was not another impostor, and said, besides, that while he should not bother about amethyst bracelets or diamonds and sapphires, yet, if that young doctor had the courage to get married within three months, and a few hundreds would help him to get into practice, why, he George Styles, had enough for such a purpose, and Harriet should take care of it, until it was wanted.

Altogether, although rougher and coarser than the first cousin, this second edition was a great improvement; and settling down as he did in Valeborough, he was a regular visitor, not only at Mr Smethby's hut at Dr Crewe's, when the latter set up his own house, after an early marriage to Miss Harriet.

And improvident and wild as George had once been, he was steady enough in his friendships now, so he never left the little circle; and when he died, his property—a good deal less than the hundreds of thousands attributed to the first cousin—went to the children of Dr and Mrs Crewe, with which cluster of young people he had always been a great favourite.

AIR AS A MOTIVE FORCE.

In a recent number of the *Journal* we touched on the various methods of transmission of power, and showed how steam had been laid on in mains in the streets of American towns, and a house-to-house distribution thus effected. Loss has been found, however, to result from leakage and condensation, and these defects have militated against the system. Water under pressure has obtained extended application in this country where power was required in docks and warehouses; but up to the present time, a motor has not been introduced satisfying the necessary requirements of economy sufficiently to render the system of commercial value for supplying small power either for domestic purposes or to the lesser industries. Bursting of pipes, through frost or other cause, might result in serious damage, moreover, in dwelling-houses.

The problem of transmission of power may possibly find a solution in electricity in the future; but as regards the present, suffice it to say that the cost of production of such agency entirely precludes it from entering into the field of competition. Attempts now being made, in Paris and Birmingham, to distribute power by rarefied air in the former, and by compressed air in the latter city, possess no slight interest. In each case, the method adopted differs in no way in principle from that of the systems already touched on. Central pumping stations, furnished with boiler and steam-power, supply the requisite energy; whilst the transmitting medium—steam, water, or air, as the case may be—is distributed through the principal mains, which feed in their turn the lesser arteries of the system supplying the individual consumer.

In the case of rarefied air, though, theoretically, a pressure of fifteen pounds per square inch could be obtained, in practice it is found advisable to work at a pressure of about ten pounds, without approaching nearer to an absolute vacuum. Three classes of motors are employed to convert the vacuum in the mains into useful work; suffice

it to say, however, that whilst differing in the details of construction, the principle involved throughout is the same, and consists essentially of modifications of the steam-engine to the requirements of air-pressure. Payment is made according to the power absorbed by each consumer, an ingenious arrangement actuating as counter, indicating how much work is actually done, irrespective of the number of revolutions made by the motor. Even where gas is available, the cost of engines for using it has not unfrequently militated against its adoption by the smaller industries; hence the Parisian Company for the distribution of power by rarefied air has elected not only to supply power but to lease out the motors as well. Their customers embrace such users of small power as hat-block makers, jewellers, wood-turners, comb-cutters, stay and clothing manufacturers, dentists, butchers, &c. The cleanliness of this system, and its excellent ventilating capabilities, should form an argument in its favour. Not only is all smell from combustion, as in the case of the gas-engine, avoided, but, by drawing at every stroke a given quantity of air from the room, the motor directly produces ventilation.

Time alone can show whether the system will prove a commercial success; in any case, its promoters could hardly have chosen a better field for its introduction than Paris, a city containing upwards of a million persons engaged in the minor industries already indicated, and which require small motive power.

A NINETEENTH-CENTURY PIRATE.

It is not likely that many of our readers will have heard of a certain Captain Hayes, who a few years ago was one of the most notorious desperadoes among the numerous 'beachcombers' and other questionable characters who infested the South Pacific. A few instances of this worthy's escapades in the paths of fraud and villainy, drawn from *Coral Lands*, by H. S. Cooper (London: R. Bentley & Son), may be of interest, and will also show how, up to a comparatively recent period, a determined character could pursue a career of actual crime and piracy in the Eastern seas with impunity.

Of the antecedents of Captain (or 'Bully,' as he was commonly dubbed) Hayes, little is known before 1858, when he appeared in the Hawaiian Islands, having landed from the ship *Orestes*. After a short stay at Honolulu, he left for San Francisco in the beginning of 1859; and a few months afterwards reappeared in command of a brig bound for New Caledonia. Having entered a closed port without having first passed the custom-house, the sheriff arrested him and took possession of the brig. Captain Hayes put all the blame on his first officer, and was virtuously indignant with him for misinforming him as to the necessity of first entering at the custom-house at Lahaina, at the same time treating the sheriff with unbounded courtesy and every mark of respect. He at once agreed to proceed to Lahaina, and seemed delighted to find it was

the sheriff's duty to accompany him thither. When, however, the ship was clear of the land, Hayes 'changed his tune,' and coolly informed the sheriff he had no intention of going near the custom-house, and that he (the sheriff) could either remain on board and pay for his passage to New Caledonia, or find his way back to port 'the best way he could. The sheriff found himself completely outwitted, and was perforce obliged to take to his small boat—luckily, still alongside—and managed to reach the land with considerable difficulty, having the melancholy satisfaction of seeing his late prisoner laughing at him over the taffrail as he resumed his course for the Southern Ocean. Next mail brought instructions to the 'United States consul at Honolulu for Hayes' arrest; and it then became known that when last in the islands he had borrowed money from a confiding clergyman, with which he had gone to San Francisco and negotiated the purchase of the brig, fitted her out, engaged his crew and then set sail, paying nobody. His cruise at this time, however, did not last very long; shortly afterwards, his ship was wrecked at Wallace's Island, the captain and his 'chums' escaping in the boat to the Navigators' Islands, leaving the rest of the crew to their fate. They ultimately, however, succeeded in getting safe to shore by means of a raft.

Hayes was next heard of at Batavia in command of a barque; how obtained is not known. He succeeded in getting a cargo of coffee for Europe—which it would never have seen—when the Dutch East India Company got some information as to his antecedents, and were only too glad to get repossession of their coffee, losing the charter-money, which Hayes insisted on being paid before he allowed the cargo to be taken on shore again. Finding he had not much chance of doing any good—or evil, rather—at Batavia, Hayes resolved to depart in search of a fresh field for the exercise of his talents. Proceeding to Hong-kong, he succeeded in filling his vessel with Chinese coolies, and sailed for Melbourne. After a fair voyage, he was nearing the Australian coast, when he spoke a ship, and was informed that a tax had been imposed on all Chinese immigrants, and that he would have to pay fifty dollars per head on his passengers before he would be permitted to land them. This was rather a serious outlook for the captain, but, as usual, his inventive brain was equal to the occasion. He sailed calmly on, and soon arrived off his port of destination. Then he set to work to carry out the plan he had conceived. He coolly filled his ship half-full of water, hoisted signals of distress, and lay to, waiting the development of his ruse. He had not long to wait; his signals for assistance were perceived, and two tug steamers were soon alongside, proffering their services for the purpose of towing him into port. Hayes declared his ship would sink before she could be got into dock, as his pumps were choked and the water rising at a great rate. He implored them to take off his passengers, leaving his crew

and himself to escape by means of their boats, should the barque not float till they returned. This the tug-owners agreed to do. The Chinamen were trans-shipped, and the steamers bore off, promising to return as speedily as possible to his assistance. They got their load of Chinamen safely landed, the owners paying the head-tax, and steamed back to bring in the ship; but she was nowhere to be seen, having, as they supposed, gone down with all hands. No such fate, however, had befallen the gallant captain. No sooner were the tugs out of sight, than he pumped his ship free of water, and lost no time in putting a good few miles between him and Melbourne, inwardly chuckling, no doubt, at the clever way he had duped the antipodeans and got his Chinamen landed at other's expense. Some time after this, Hayes speculated in another cargo of Chinamen; but this time he landed them without trouble and without paying anything, having gone through the formality of getting them all made British subjects before he sailed!

For a few years after this, Captain Hayes was little heard of, except at some of the South Pacific islands, where he occasionally turned up, ostensibly pursuing the avocation of an honest trader. By-and-by, however, he resumed his old habits, and for a couple of years or so he made raids on several of the island groups, robbing and destroying the stations of the traders and native villages. Eventually, he was arrested by the British consul at Upolu. As luck would have it, at this same time a certain friend of Hayes, Captain Pease or Peace, arrived at Upolu in his brig the *Leonora*. On some pretence or other, Hayes obtained leave to go on board; and when next morning dawned, the brig was invisible, having sailed during the night with him on board as a passenger. In due time, the *Leonora* arrived at Shanghai, and by some dodge or other, Hayes managed to get Captain Pease put in prison, passing himself off to the authorities as the owner of the brig. He next got on board the supplies he was in need of, and set sail, as usual paying for little or nothing. Hayes once more was in command of a good ship, with a crew who asked no questions, and in a position to resume his fraudulent career. His first port of call was Saigon, where he was chartered to take a load of rice to Hong-kong and other intermediate ports. At the first port of call, the owner of the rice went on shore to try and effect a sale. Hayes took this opportunity of leaving the owner behind, and set off for Bangkok, where he disposed of his cargo at a good price, and departed once more for his favourite hunting-ground—the South Pacific.

Hayes some time after this was again without a ship, having imprudently intrusted his vessel to the care of his first officer, who treated the 'Bully' to a dose of his own game, and went off with her, leaving him in a quandary on one of the South Pacific islets. Hayes was now forced to change his play, and accordingly came out in a new character. Pretending to be converted from his evil ways, he completely got the better of the American missionaries, and obtained command of a small schooner belonging to the Mission. At the first favourable opportunity, as may be supposed, he disappeared with the schooner, and arrived at Manila. Here, however,

his fame had preceded him, and on being recognised, he was promptly arrested, and put in prison. The captain's game seemed now about up; but his good luck had not yet deserted him. Once more adopting the religious dodge, he turned a devout Catholic, and so talked over the priests, that, although there was evidence enough to hang him and a dozen others besides, he got off, and was next heard of at the scene of his first escapade, San Francisco, where he stole a smart schooner called the *Lotus*, and once more was off for the Sunny South.

On another occasion, Hayes was captured by the U.S. steamer *Naragansett*, which had been commissioned to look out for him. He was not many days on board the war-ship, when, by his affable manners and gentlemanly behaviour, he so won over the sympathies of the American officers, that they became convinced he was a most worthy individual, and set him free, actually supplying him with a new set of sails and other articles he was in need of!

On another occasion, Hayes called at Levuka, the capital of Fiji, to obtain supplies for a lengthened cruise. The goods were sent on board, and the bill rendered, payment being expected next morning before he sailed; but when the day dawned, the captain, as usual, was off. Unfortunately for him, however, in this instance the wind failed him, and the merchant was able to overtake the ship in a rowboat.

The captain was not at all put about when the merchant came on board; said 'he presumed he would have letters for him to post, and would be delighted to be of use.' The merchant was rather taken aback at such coolness in an absconding debtor, and mildly hinted at payment of his account.

'Why,' exclaimed Hayes, 'you were paid yesterday!'

The merchant assured him that he was mistaken.

Hayes expressed astonishment, and ordered up one of his officers. 'Didn't I give you the cash to settle this gentleman's bill?' he asked indignantly; and then the 'Bully' opened the vials of his wrath upon the innocent seaman, who was cunning enough to see the captain's object, and held his tongue. Seeing, however, that there was no sign of a breeze springing up, he was forced to pay for his supplies, no doubt very much chagrined at having to be honest for once in his lifetime.

After a long career of robbery and bloodshed—for he gets the name of having perpetrated several murders—Hayes at last met his deserts at the hands of one of his officers, whom he had defrauded and ill-used in a most disgraceful manner. No doubt, the secret of his eluding the hands of justice for so long a time was his particularly pleasing manners and appearance. He was by no means a common ruffian, but the reverse, having a handsome face and figure, and bestowing a deal of care and attention on his personal appearance. His urbanity of manner and conversational powers were of the most fascinating description, and he could entertain a friend or knock him on the head in an equally charming style. When he first appeared in the Pacific, he was accompanied by 'Mrs Hayes,' and was seldom without a female companion, several

of whom are said to have been among his victims. He was possessed of great natural abilities. If he had only turned his talents into a proper channel, he might have made a good position for himself in the world.

THE MONTH:

SCIENCE AND ARTS.

MR C. TANKERVILLE-CHAMBERLAIN, late acting consul at Panama, gives a hopeful account of the progress of M. de Lesseps' giant undertaking, the construction of the Canal across the Isthmus, which is very different from the description of the state of things lately published in the American newspapers. He believes that the great work will be actually completed in about three years' time. The line of the Canal, forty-six miles in length, has been divided into five sections, which have been handed over to five responsible and solvent contractors, who are bound under heavy penalties to complete their work by the end of 1888. The holders of railway stock and many others in America are interested in believing, and trying to make others believe, that the Canal is a failure and cannot succeed. That it will be a financial success, must remain an open question, for the expense already incurred, added to that which is to come, constitutes a larger sum than has ever yet been sunk in a single engineering undertaking.

A proposal is now on foot to connect by means of a submarine tunnel the defences of Portsmouth with the forts on the Solent and with the Isle of Wight, and it is probable that preliminary borings will be made to ascertain the practicability of the scheme. It has been before proposed that a fort should be built half-way between Stokes Bay and Ryde, on a bank which rises to within eight feet of high-water mark; but the scheme was abandoned because of the difficulty of finding fresh water for the garrison. The tying together of this proposed fort and the other defences would at once obviate this difficulty, and would at the same time relieve our expensive ironclads from the duty of protecting a spot which has always been looked upon as of great importance.

Among all the wonderful things which were exhibited in the late Colonial and Indian Exhibition, there was nothing more remarkable than the vast variety of different woods—strange to European eyes—which were shown in some of the Courts. These woods seemed to exhibit every shade of colour and every variety of grain. In one Court in particular could this be well remarked, for the different samples of wood were cut into the shape of books and highly polished, each 'pseudo volume' bearing its own name. Messrs A. Ransome & Co. lately invited a number of colonial visitors—engineers, builders, and others—to their large works at Chelsea, in order that they might demonstrate the applicability of some of these woods to various purposes.

About forty different varieties were subjected to the operations of tree-felling, cross-cutting, sawing, planing, moulding, mortising, tenoning, and boring; while various articles, from casks to doors, were actually made and completed before the visitors' eyes. The exhibition not only formed an illustration of the suitability of many colonial woods for employment in this country, but it also showed to what a marvellous pitch of perfection wood-working machinery has been brought by Messrs Ransome. The demonstration is likely to lead to a great shipment of colonial woods to this country, many of which are plentiful, and therefore cheap.

The colossal statue of Liberty, which has been presented by the French Republic to the Republic of America, and which, with the pedestal, is over one hundred and fifty feet in height, is, at the time we write, nearly completed. When the statue is quite finished, it is proposed to illuminate it at night in a very novel manner. The female figure of Liberty holds aloft a torch, which will be furnished with eight electric arc lamps, each of six thousand candle-power, the rays from which will be thrown upwards towards the clouds. At the same time, several other lamps of similar power will shine on the statue itself, causing it to stand out in strong relief from its dark surroundings.

A correspondent of the *Times*, quoting a letter recently received from Sydney, New South Wales, gives an account of the extraordinary instinct shown by ants and other insects which live in and on the ground. Some months ago, the natives of a certain district predicted the approach of floods, and left their low-lying camping-grounds for the higher country. The floods came as predicted, several weeks later; and the natives said that their sole information regarding them was gathered from the insects, which had built their nests, &c. in the trees, instead of, as usual, in the ground. The correspondent asks whether this forecasting providence of the ant is recorded by any of our travellers, and whether any explanation of the fact can be given.

Here are two more natural-history notes recorded by correspondents. It is pointed out by one that, owing to our backward spring this year, the swallows on their arrival were kept so short of food that quite two-thirds of their number died of famine; hence the unusual plague of flies that we have experienced during the summer. He pleads that the little mud nests which are seen clinging under the eaves of so many houses in country and suburbs should be protected from injury, for if it were not for the swallows, flies would constitute a veritable pest.

In answer to this, another writer points out that sparrows will sometimes prevent the swallows building, and will often drive the rightful owners from their nests. This fact he has ascertained by direct observation. He also remarks that the swarms of flies this year may be due in great measure to the scarcity of wasps, which destroy an immense number. The scarcity of wasps in his particular neighbourhood is fully accounted for, one of his friends having destroyed

no fewer than sixty-seven of their nests. His plan of procedure is, as far as we know, as novel as it is simple and effective. Tow soaked in spirits of turpentine is thrust into the wasp's nest at night, and the hole is afterwards filled up—presumably with earth.

We are so accustomed to wonderful news from the land of Niagara, that we are not much surprised to learn that the largest photographic negative ever produced has been taken by an American worker. The glass plate upon which the colossal picture was taken measured sixty by thirty-six inches, and weighed more than eighty pounds. The coating with sensitive material of such a plate was in itself a very difficult undertaking, while for its development after exposure in the camera, over three pailfuls of fluid had to be cast over its surface while it was lying in a specially constructed tray. The photographer succeeded in obtaining a good picture, as well as a silver medal to reward him for his enterprise.

A French journal says that flowers may be preserved with all their natural brilliancy and freshness by dipping them into a mixture made as follows: In a well-corked bottle, dissolve six drachms of coarsely powdered clear gum-copal; add the same quantity of broken glass, and fifteen and a half ounces (by weight) of pure rectified sulphuric ether. The flowers should be dipped into this varnish-like fluid four or five times, allowing them to remain in a current of air for ten minutes between each immersion. This plan, if it does not interfere with the delicate texture of the petals, should be of use to flower-painters, who often have to hurry their work unduly because of the perishable nature of their models.

Mr Graber has lately made some curious observations upon the effect of light upon eyeless animals, a Report of which appears in the Proceedings of the Vienna Academy. He put a number of earthworms into a box, which was provided with an aperture at one side, through which light was allowed ingress. The result of many experiments showed that the worms sought the darkest part of their temporary prison, and that at least two-fifths of their number shunned the light. Experimenting with rays of different colours by means of stained glass, he found that the worms exhibited a marked preference for red light.

According to the *American Druggist*, an alloy which will solder glass, porcelain, and metals, or one to the other, can be made in the following manner: Copper dust, made by precipitating the metal from a solution of bluestone by means of zinc, is put into a mortar and treated with strong sulphuric acid. To this mass, formed by the copper and acid, is added a little more than twice as much mercury, the addition being made with constant stirring. The amalgam thus formed is washed with warm water to remove the acid, and is afterwards cooled. When required for use, it is heated, and worked in a mortar until it becomes as soft as wax, and in this state it will cling tenaciously to any surface to which it may be applied. It is applicable more especially to those substances which will not bear a high temperature.

A year ago, Mr J. W. Swan of Newcastle described before the North of England Institute of Mining and Mechanical Engineers an electric

safety-lamp which he had invented for the use of miners. This lamp, although efficient, had no means of detecting the presence of firedamp. In an improved lamp which the same inventor has produced, this deficiency is supplied, for a firedamp indicator forms part of the lamp. This indicator is based upon one invented some time ago, and consists of a coil of platinum wire which can be switched on to the current which supplies the lamp and brought to a red-heat. If firedamp be present, the wire becomes far hotter, and therefore brighter than it will in pure air; and in one form of lamp a similar coil, shut up in a glass tube containing air, is provided, for the sake of comparison. In another form of indicator the hot wire is made to explode the charge of firedamp submitted to it, of course in a closed chamber, thus forming a partial vacuum, which acts upon a column of liquid in an attached gauge tube. By this means the exact percentage of fiery gas present can be accurately noted. It may be hoped that these improved appliances may come into common use; but of course electrical fittings are somewhat expensive, and this is the initial difficulty in introducing improvements which would lead to much saving of life.

In these enlightened times, when books without number are published to instruct even the youngest scholars about the nature of common things, it seems almost impossible to realise the ignorance which existed and the nonsense which was written even as lately as the last century concerning matters of the most elementary kind. So-called facts in natural history of the most ludicrous kind were handed down from writer to writer and accepted as the exact truth by all readers. Here is a specimen of chemical knowledge which dates from the year 1747, and is due to the pen of one George Adams. He naively remarks that 'some people have imagined that the sharpness of vinegar is occasioned by the eels striking their pointed tails against the tongue and palate; but it is very certain that the sourest vinegar has none of those eels, and that its pungency is entirely owing to the pointed figure of its salts, which float therein.' There is probably some confusion here between the sourness of vinegar and the acidity of sour paste, which latter is accompanied, as even young microscopists know well, by the development of innumerable so-called eels.

At a recent meeting of the Society of Medical Officers of Health, Dr Alfred Hill, the President, delivered an opening address, which dealt with the important subjects of the disposal of house-refuse and the best method of treating sewage. The employment of destructive furnaces for getting rid of dry house-refuse was strongly recommended. The efficient disposal of sewage is of course a far more difficult problem to solve, and one which has now for a number of years troubled the minds of many. Dr Hill is in favour of the sewage-farm principle, which has been so successfully tried at Birmingham. He showed that the system had not proved a nuisance to adjoining residents nor yet injurious to health. It was also a profitable system, for in the city referred to, twenty thousand pounds had been realised during the past year by the sale of stock and produce from the sewage-farm. He believed that if a similar system were adopted for the

metropolitan area, the sewage which is now allowed to poison the Thames might realise in meat, milk, and vegetables two hundred thousand pounds.

Mr Thomson Hankey has lately pointed out a new use for sugar, which, however, is not new, but it is so little known that he has done good service in calling attention to it. In the preparation of mortar and cement, the addition of a certain quantity of unrefined sugar will give the mixture extraordinary hardness and tenacity. In India, sugar has been used for this purpose from time immemorial, and walls built with mortar of this description will defy all ordinary methods of destruction. Plaster of Paris will also set much harder if about ten per cent. of sugar be added to the water with which it is mixed. With plaster of Paris, it might be mentioned, the addition of alum has much the same effect.

At one of the recent meetings of the Iron and Steel Institute, M. Gautier of Paris read an interesting paper on 'The Casting of Chains in Solid Steel.' In the course of this paper, he pointed out that in order to compete successfully with wrought-iron in chain-making, the steel employed must be quite solid and absolutely free from blowholes, and it is most necessary to adopt a quick method of moulding the chains. In the process which has been adopted by Messrs Joubert and Leger of Lyons, these difficulties have been successfully overcome. The process combines chilled casting with instantaneous removal from the moulds, after which the chain is finished and annealed in oil. By this method he claims that better chains can be manufactured than those of wrought-iron, with the advantage of greatly diminished weight.

The deposition of dust and smoke by the passage of electricity has been more than once adverted to in these pages, more especially in connection with the collection of lead-fume. Messrs King, Mendham, & Co. of Bristol have recently constructed a convenient piece of apparatus for illustrating this phenomenon. It consists of a jar capped at the top with a cover, through which protrudes a rod furnished with a ball. This rod terminates inside the jar in a point; and a similar pointed wire, which finds a termination outside the lower part of the jar, is opposite to it. Below, there is a small combustion box, in which a smouldering piece of brown paper will soon fill the jar with smoke. Thus filled, the jar is connected by its brass terminals to a Wimshurst Electrical Machine. When the handle of the machine is turned, an electrical discharge takes place between the two pointed wires; and the smoke, after being violently agitated, disappears, leaving the air in the jar perfectly clear.

The Simplex Ironing Machine, which is invented by Mr S. Bash, and which has been examined and approved by the leading tailoring establishments in London and Paris, is designed to relieve workers from the heavy manual labour attending the use of pressing-irons. The simplex iron is suspended from a movable arm by a universal joint, and can be moved in any direction over the work and with any desired degree of pressure. This pressure is brought about by the aid of a pedal attachment. There is also provision made for pressing long seams, a movable

table being made to travel to and fro beneath the gas-heated iron. The inventor claims for his method a saving in fuel and more rapid and efficient work.

A new explosive has been invented by a Russian engineer, M. Ruckthell, about which some very curious particulars have been published, while the nature of the compound remains the secret of its discoverer. The explosive gives a penetrative power to projectiles ten times greater than gunpowder. It emits neither smoke nor heat, and its discharge is unaccompanied by any report. If this be true, can the compound—whatever it be—be called an explosive? But this wonderful product is to be utilised in the arts of peace as well as those of war, for it forms the motive-power for an engine constructed by the inventor, an engine for which he claims superiority over steam and gas engines. It will be remembered that an engine of much the same character was invented a few years ago in America. Its motive-power was a secret from everybody. The necessary and inevitable Company was formed to buy up the inventor's rights, and then—nothing more was heard of it.

Mr W. F. Dennis has been exhibiting at Millwall, London, a continuous wire-netting machine, which is a great improvement on former contrivances of this kind. The machine works from bobbins of wire only, not from bobbins and spools, as in the older machines, and these bobbins contain a sufficient length of wire to keep the machine at work for a whole day. In a day of ten hours, a single machine will produce three hundred and fifty yards of wire-netting twenty-three inches in width. The machine in question occupies a space of eleven by eight feet, by six feet in height. Nor is it confined to the production of netting from soft metal, for hard bright steel and iron wire can be used, producing a most rigid product. The consumption in Europe of wire-netting is estimated at forty million yards per annum, and the possibility of producing it of a rigid character, hitherto thought to be impossible, is sure to increase its fields of usefulness.

OCCASIONAL NOTES.

WOODITE.

WOODITE, a newly invented preparation of caoutchouc—so called from the name of its inventor—is attracting considerable attention at the present time. In woodite are united the useful elastic properties of india-rubber together with the advantages of immunity from injury by fire or salt water. The specific gravity of woodite is only one-tenth that of iron or steel; whilst the cost of the new material, as compared with these metals, is estimated to be as three to seven, or rather less than one half. Such facts fully explain the importance attached to the proposition now being made to utilise woodite as a protection—either internal or external, as regards the vessel's skin—to men-of-war and torpedo boats. Experiments recently made to ascertain the behaviour of woodite under fire were as satisfactory as conclusive, and established the interesting fact, that the caoutchouc closed up again so thoroughly and instantaneously, after the

passage of the shot, that no leakage resulted, though the vessel was pierced below water-line.

The value of a material possessed of such qualities for naval purposes cannot be overestimated; whilst in a variety of other ways, woodite appears likely to play a not unimportant part in the near future. In the construction of lifeboats, a material so buoyant and indestructible cannot fail to be of service; whilst for lining quay walls, harbour entrances, piers, landing-stages, and the numberless cases where it is desirable to moderate the force of impact, woodite should be found of the greatest value. In the case of a collision at sea, a vessel fortified internally or externally with woodite would be more likely to remain afloat, than, *ceteris paribus*, one not similarly protected.

In an age when every effort is made to secure the requisite buoyancy in our huge floating citadels, heavily laden with ponderous armour and gigantic ordnance, a material combining buoyancy in so high a degree, with its other advantages, cannot but be destined, in the opinion of competent judges, to play a brilliant part; whilst its future in the more peaceful arts cannot fail to be equally commensurate with its merits.

TRAVELLING ARRANGEMENTS ON THE CANADIAN PACIFIC RAILWAY.

A passenger by the Canadian Pacific Railway gives an interesting sketch of the travelling arrangements on this latest trans-continental line. We learn that the locomotives have a haul of about one hundred and twenty to one hundred and thirty miles in each division of the line, when they are changed, and fresh ones put on. The continent is crossed from Montreal to Vancouver, in British Columbia, in five days and fourteen hours; and this will soon be reduced to one hundred and twenty hours. Good time is kept. The first east-bound trans-continental train that was met in transit, passed Sudbury, going eastward, at 4.17 P.M., after being about five days on the journey. Before its arrival, there was some curiosity to learn whether it was in time, and bets were made on the time it would arrive. This train, after travelling a distance of two thousand five hundred miles, arrived only fifteen seconds behind time. The railway route from Montreal to Vancouver covers two thousand nine hundred and nine miles; and the through sleeping-coaches attached to the train run the entire distance without change, which is a great comfort to the traveller. Every week-day, a train starts from each end of the line, leaving the eastern terminus at Montreal at eight o'clock in the evening, and the western terminus at one o'clock in the afternoon. On Sundays, the trains do not start; thus making six trains each way every week. The west-bound train is called the Pacific Express; and the east-bound train the Atlantic Express.

The Pacific Express, in which this correspondent travelled, was made up of five coaches. At the head was the luggage, mail, and express coach, which carried the baggage. The next is the colonists' coach, a third-class carriage with seats arranged so that they can be turned into a double tier of berths on each side for sleeping

accommodation. The train carries passengers at three rates. The ordinary American first-class passenger coach follows the colonists' coach, which usually takes local travellers along the line. Following this is the dining-coach, which usually accompanies the train only from seven o'clock in the morning till nine o'clock at night. Following the dining-car is the through sleeping-coach, which is constructed with six sections on each side. In the aggregate, twenty-six persons can be given sleeping accommodation in this car; while at one end, toilet-rooms and a bathroom are provided. At the rear of the sleeping-coach is a large open apartment with a good outlook, which can be used as a smoking-room, and, where passengers may have a view of the line passed over.

OVERHEAD TELEGRAPH WIRES.

This arrangement of wires has always been considered as a disfiguring and dangerous eyesore, and at last our quick-sighted cousins 'across the water' have determined that the nuisance shall be forthwith abated. In New York, Washington, St Louis, Chicago, and other great cities of the United States, legislative decrees have been issued for the compulsory abolition of all overhead wires, which will in future be conducted underground in tunnels beneath the pavement, and by this means a great improvement will be effected in the matter of street architecture, and some dangers to passengers will be removed. Many instances have been known in America where, from violent storms of wind or snow, the telegraph posts have been blown down, occasioning injury and even death to passengers. All this will be avoided by the new arrangement.

ANGRY BEES.

As a supplementary note to the article on 'Bees and Honey' which appeared in No. 135 of the *Journal*, a correspondent sends us the following:

'A painful instance of the terrible consequences of provoking bees is connected with one of the loveliest sights in India, the famous Marble Rocks of Jubbulpore. These rocks form a gorge through which the great river Nerbudda flows, and the marble formation extends for about a mile. The dazzling walls which shut in the river are studded with pendent bees' nests, and for any one proceeding in a boat down the narrow channel to disturb the bees is a fatal proceeding. If any warning were required, it is given by a tomb which stands on the outskirts of the village just above the gorge, to the memory of one who was stung to death in this beautiful spot. Actuated by a foolish impulse, he fired his rifle at one of the nests, whereupon the bees came down on him in such numbers that he attempted to save himself by jumping overboard. The relentless insects, however, still pursued him, with fatal results. I quote the story from memory, but believe it is to be found in detail in Forsyth's charming work, *The Highlands of Central India*.

'A friend once told me that as he was driving near a village some miles from Jubbulpore, he and his servant and horse were attacked by bees

without any real provocation. The enemy crowded round in such numbers that the situation became serious. After receiving several stings, and finding the horse, too, becoming restive, my friend resolved to save his own life and that of his servant, both of which were really in jeopardy, at the risk of a little discomfort to other people. Accordingly, he whipped up his horse and made for the village, a cloud of bees keeping up with the trap without the least effort. When the village was reached, the bees, as my friend anticipated, found so many other objects of interest, that they distributed their attentions with less marked partiality than hitherto. In other words, the cloud left the trap and scattered among the villagers, who were, however, so numerous, that two or three stings apiece probably represented the total damage. The expedient was not, perhaps, a charitable one, but, in the circumstances, was, I venture to think, justifiable.'

The PUBLISHERS have pleasure in intimating that next year will appear in this JOURNAL an Original Novel, entitled

RICHARD CABLE,

by the distinguished Author of the well-known works of fiction, 'Mchalah,' 'John Herring,' 'Court Royal,' &c.

A BRIGHT DAY IN NOVEMBER.

A SUMMER hush is on the golden woods;
The path lies deep in leaves—the air is balm;
No sound disturbs these silent solitudes,
Save some faint bird-notes, which, amid the calm,
Seem like the sad, sweet song of one who grieves
Over a happy past—yet with a strain
Of Hope, which sees amid these yellow leaves,
Bare boughs all clothed with Spring's young buds again.

Even thus, most gracious Lord, in Sorrow's hour,
When Life seems saddest, and our hopes decay,
Thou sendest comfort—as, in wood or bower,
Some humble flower remains to speak of May;
Some gleam of joy lights up the wintry scene;
Some tender grace returns to bless and cheer;
And though our trees no more are clothed in green,
Bright days may light the closing of your year.

J. H.

The Conductor of CHAMBERS'S JOURNAL begs to direct the attention of CONTRIBUTORS to the following notice:

- 1st. All communications should be addressed to the 'Editor, 339 High Street, Edinburgh.'
- 2d. For its return in case of illegibility, postage-stamps should accompany every manuscript.
- 3d. To secure their safe return if illegible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.
- 4th. Offerings of Verse should invariably be accompanied by a stamped and directed envelope.

If the above rules are complied with, the Editor will do his best to insure the safe return of illegible papers.

Printed and Published by W. & R. CHAMBERS, 47 Paternoster Row, LONDON, and 339 High Street, EDINBURGH.

PRICE 1½d.

'ON GUARD' AT WINDSOR CASTLE.

THOUGH the honour implied in the protection of the principal residence of the sovereign is considerable, military duty at Windsor is not by any means held in high estimation by soldiers, that is to say by those whose lot it is to perform the ordinary functions of 'sentry-go' around the castle. In a word, the duty is 'hard.' This term, applied to peace-time soldiering, means that the men have few 'nights in bed'—the criterion by which such service is invariably judged. At some stations the rank and file have as many as twenty of these coveted consecutive nights in barracks; but at Windsor the present writer has at times enjoyed the honour of passing every third night on the exposed terraces of the castle; and as the 'Queen's Regulations' lay particular stress on each soldier heaving at least one 'night in bed' before going on guard, it will be greeted that the Windsor duty is not unjustly considered somewhat trying. Perhaps a glimpse at the inner life of the Castle-guard may interest some readers.

The armed party, which consists of some fifty soldiers, is under the command of an officer, assisted by two sergeants, together with as many corporals, and it enters upon its twenty-four hours' tour of duty in the forenoon. A drummer-boy also 'mounts': his chief employment being to go messages and to carry the lantern used in making the nocturnal 'rounds.' When the guard marches into the lower ward of the castle, after having in its progress considerably enlivened the quiet streets of Windsor, the 'old' guard is formally relieved, and the men not immediately required as sentinels take possession of the guardroom—a large, comparatively modern building, in the vicinity of the antique Curfew Tower. With a view, probably, to the preservation of discipline, the two sergeants are provided with a 'hunk,' a small portion of the area of the apartment partitioned off, and fitted with a miniature guardbed. Here they often employ their time in the making up of pay-lists, duty-

rosters,* and the like. On entering the guardroom, the privates quickly divest themselves of their valises and folded greatcoats; for it is now admitted by the authorities that a sentry may march about quite 'steadily' without being constantly burdened with his kit. The valises are suspended from rows of pegs furnished for this purpose; and—what might in fine weather seem surprising—the greatcoats set free from their tightly huddled straps. Ostensibly, the 'loose' coats are necessary to spread out on the guardbed, so as to slightly soften that uneasy couch, as well as to prevent dust, which may there have lodged, from adhering to the tunics of recumbent guardsmen. But the real reason for shaking out these garments frequently is to allow them to dry, because in many cases they have been liberally sprinkled with water before being buckled up, to insure a more compact 'fold.'

A stranger to things military, on surreptitiously glancing in at the guardroom door early in the day, and while the sentry's back was turned, would notice a large number of white basins drawn up on the tables and 'dressed' with extraordinary precision. These vessels are placed in position for the reception of the soup, which is served shortly before mid-day, and they bring us to the important subject of the culinary department. There are four cooks connected with the castle guard. One is 'corporal of the cooks'; another is 'standing' (or permanent) cook; and the remaining two are merely sent daily on 'fatigue' from the barracks. The provisions are conveyed to the castle in a herow of peculiar construction, and deposited in the cook-house—a place not at all resembling a conventional kitchen, but both in situation and appearance very like the dungeons one is occasionally introduced to when visiting ancient strongholds. In this dismal region are capacious 'coppers,' in any one of which soup, beef, vegetables, or tea can be prepared.

* *Roster*, in military language, is the list of persons liable to a certain duty.

To return, however, to the proceedings of the members of the guard. When they have satisfactorily arranged their equipments and, above all, thoroughly repolished their boots, a corporal calls for silence. This obtained, he begins to make out the duty-roll, or 'detail' as it is usually termed, of the sentries; and when the detail is completed, he affixes to the wall in a primitive fashion—with pieces of damped ration bread—a short abstract, in which the men are represented by figures. To the uninitiated observer, the purport of this might be rather puzzling. After a particular numeral, for example, is inscribed the word 'Cocoa.' The soldier to whom it refers has assigned to him the task of preparing the beverage named, which is issued to the guard at midnight—the 'standing' cook having the privilege of every night in bed. The abstract is attentively perused by the men, who sometimes take private memoranda of the parts of its contents that apply to them individually. Not infrequently this is done with a pencil on their pipelayed gun-slings, in such a position as not to be apparent to the inspecting officer.

As soon as every one has mastered the corporal's hieroglyphics, a sergeant issues from the hunk already alluded to, bearing the 'order-board,' which is of rather portentous dimensions. As the great majority of the men know the regulations off by heart, they are read in a slightly hasty and perfunctory manner; though, with true military exactness, not a word is omitted. There is little in the list of orders that calls for special remark; but one paragraph is, we imagine, almost if not quite unknown elsewhere; it relates to the conduct of the corporals when marching round the 'reliefs.' If, when so marching along with his men, Her Majesty the Queen should meet or pass the party, the non-commissioned officer is directed to halt his subordinates, draw them up in 'open order,' and see that the appropriate salute is rendered. The curious order which prohibits soldiers from 'working at their trade while on guard' is of course represented on the board; but as a matter of fact, some men pass a good deal of their spare time in the not very martial occupation of making headwork pinctions. These articles, however, command somewhat tempting prices, especially in the metropolis.

While the men of the guard have thus been engaged, the commandant has taken over his quarters, adjacent to the guardroom, and reached by a pretty long stone stair, well worn by the iron-shod heels of many generations of corporals and drummer-boys. Soon after mounting duty, the officer is joined by his servant, who brings with him a portmanteau containing various comforts. A cooking department is also required in the case of the officer, whose meals, however, are conveyed to him by the messmen from barracks. Before long, the steps of a corporal ascending the stair warn the captain of the guard that the hour approaches for him to march off the 'second relief.'

The 'posts' are numerous. One sentinel paces about in front of the guardroom, much of his attention being devoted to saluting the Knights Pensioners of Windsor, who reside in the lower ward of the castle. Another soldier has ample leisure to examine the architectural features of

the celebrated Round Tower, at the base of which he is stationed. A third takes post on the North Terrace, where a splendid prospect enlivens the monotony of his vigil, and whence, if of a philological turn, he can contemplate the windings of the river which are said to have given the place the name Wind-shore, or Windsor. Or, if historically inclined, he may recollect that the North Terrace was once the favourite promenade, for an hour before dinner, of Queen Elizabeth, to whom it is alleged the English soldier was originally indebted for his daily ration of beef. Then there are two sentries on the eastern façade of the castle. These men are in close proximity to the royal apartments. By night, they do not challenge, in the ordinary manner, but by two stamps with the right foot; and they are charged to pronounce the words 'All's well' in an undertone. The grand entrance to the upper ward of the castle is in the keeping of a 'double' sentry, as is also a gate near at hand; and there are several other sentry-posts which it would be tedious to visit in detail. In each sentry-box hangs a heavy watchcoat, which the soldier may put on when he thinks fit, and of the large buttons on this cloak he is expected to take sedulous care.

By night, the sentinels around Windsor Castle are slightly augmented in number; but it will only be necessary here to notice one nightpost, the cloisters of St George's Chapel. This is a somewhat eerie quarter in the small-hours. There is a military tradition to the effect that the cloisters are occasionally visited by shadowy and unearthly forms, to the perturbation of young soldiers. The writer has had no experience of these supernatural visitants; but he has noticed, when marching round the relief, an unusual alacrity on the part of some men to quit the cloisters.

While the men on guard are engaged in their usual routine, the officer is not altogether idle; he inspects and marches off the relieving detachments at intervals of two hours; and in the afternoon visits the sentries, taking pains to ascertain that they are familiar with their instructions. At eleven o'clock at night he makes his 'rounds,' preceded by the drummer-boy with his lantern, as well as by a corporal bearing a bunch of keys, wherewith to open a number of iron gates in and near the castle; and when the rounds return to the lower ward, the captain of the guard is at liberty to retire for the night.

In the morning, such members of the guard as may be slumbering are roused by the arrival of the cooking-party; and soon afterwards the officer's man, with his portmanteau, appears on the scene. Before long, a sergeant comes forth from the 'bunk,' uttering the mandate: 'Get these coats folded.' During the period when the equipments are being operated upon, the senior sergeant is engaged on the 'guard report.' One important part of this is already in print upon the form, and it commences by saying that 'Nothing extraordinary has occurred during my tour of duty.' When the sergeant has carefully finished the report, he takes it to the officer for signature, and on his return calls out: 'Fall-in the guard.' The men, who are already fully accoutred, promptly form-up outside the guardroom; and the commandant is seen descending

the stair from his quarters. Then the 'new' guard arrives. In the course of half an hour, the first stroke bestowed by the big-drummer on his instrument announces to the 'old' guard that their tour of duty is at an end.

BY ORDER OF THE LEAGUE.

BY FRED. M. WHITE.

IN TWENTY CHAPTERS.—CHAP. XVII.

WHEN Maxwell came to himself, it was broad daylight. He was lying upon a straw mattress in a small room, containing no furniture besides the rude bed; and as he looked up, he could see the rafters, black with dirt and the smoke of ages. The place was partly a house, partly a hut. Gradually, as recollection came back to him, he remembered the events of the previous night, wondering vaguely why he had been selected as a victim for attack, and what brought him here. By the clear sound of voices and the rush of water, he judged himself to be in the country. He had no consciousness of fear, so he rose, and throwing open the heavy door, looked out. Towering away above his head were the snow-capped peaks of mountains, and below him the spreading valley of the Campagna. Wood upon wood was piled up before him, all aglow with bright sunlight, the green leaves whispering and trembling in the breeze. The hut was built on a long rocky plateau, approached by a narrow winding path, and ending in a steep precipice of two hundred feet, and backed up behind by almost perpendicular rocks, fringed and crowned by trees. In spite of his position, Maxwell drew a long breath of delight; the perfect beauty of the scene thrilled him, and appealed to his artistic soul and love of the beautiful. For some time he gazed upon the panorama, perfectly oblivious to his position, till gradually the sound of voices borne upon the wind came to his ears. He walked to the side of the hut and looked around.

Seated upon the short springy turf, in every picturesque and comfortable position the ingenuity of each could contrive, were four men, evidently, to Maxwell's experienced eye, banditti. They seemed peacefully inclined now, as they lounged there in the bright sunshine smoking, and renewing the everlasting *papiloto*, without which no such gentry are complete, either in the pages of fiction or as portrayed upon the modern stage. With the exception of one, evidently the leader, there was nothing gorgeous in their costume, it being the usual attire of the mountaineers; but the long carabines lying by their sides and the short daggers in their waistbands spoke of their occupation. Maxwell began to scent an adventure and enjoy the feeling; it would only mean the outlay of a few pounds, a little captivity; but when he approached nearer, and saw each bearing on some part of his person the gold moldore, his heart beat a trifle faster as he stepped forward and confronted the group.

'What is the meaning of this?' he asked, in the best Italian at his command. 'I suppose it is merely a question of ransom. But it is useless to put the figure too high. Come, what is the amount?'

The brigands looked to each other in admiration of this coolness. Presently, the leader removed his cigarette from his mouth and spoke: 'You have your watch, signor, and papers; you have your rings and purse. It is not our rule to forget these with an ordinary prisoner.'

Maxwell felt in his pocket, and, sure enough, his valuables were perfectly safe—nothing missing, even to his sketch-book. For the first time, he began to experience a sensation of fear. 'Then, if plunder is not your object, why am I detained?'

'Plunder is not a nice word to ears polite, signor,' the leader replied with a dark scowl. 'You are detained by orders. To hear, with us, is to obey. You will remain here during our pleasure.'

'But suppose I refuse to remain?'

Without rising, the brigand turned on his side and pointed towards the sheer precipice, and then to the wall behind; with a gesture he indicated the narrow winding path, the only means of exit, and smiled ironically. 'You may go; there is nothing to prevent you,' he said; 'but before you were half-way down the path yonder, you would be the target for a score of bullets, and we do not often fail.'

Maxwell was considerably impressed by this cool display; and indeed, when he considered the matter calmly, there appeared no prospect of immediate escape. Demonstrances or threats would be equally unavailing, and he determined to make the best of his position. 'Perhaps you would not mind telling me why I am here, and by whose orders you have arrested me. It would be some slight consolation to know how long I am to stay. I am anxious to know this,' he continued, 'because I am afraid your mountain air, exhilarating as it is, will not suit me.'

The group burst into loud laughter at this little humour: it was a kind of wit they were in a position to appreciate.

'It is impossible to say, signor. We only obey orders; we can only wait for further instructions as regards your welfare—or otherwise. We were told to bring one Maxwell here, and lo! we have done it.'

'I see you are brothers of the League,' Maxwell replied; 'and for some act of omission or commission I am detained here. You can at least tell me by whose orders you do this.'

'Signor, they say you are a traitor to our Order.'

'That I am not!' Maxwell cried indignantly. 'Tell me why I am here, and at whose orders. There is some mistake here.'

'Not on our part, signor. The instructions came from London. I only received them last night. You will be well treated here, provided you do not make any attempts to escape. For the time, you are our guest, and as such, the best I have is at your disposal. If orders come to release you, we shall conduct you to Rome. We shall do everything in our power to serve you. If, on the other hand, you are tried in the balance and found wanting, we shall not fail to do our duty.' He said these last words sternly, in contrast to the polite, grave manner with which he uttered the first part of his speech.

Maxwell had perception enough to comprehend his meaning. 'You mean that I should

have to die,' he observed. 'I suppose it would be a matter of the utmost indifference to you, either way?'

'As a matter of duty, signor, yes,' he answered gravely; 'though I do not wish to see a brave man die; but if the mandate came to that effect, I must obey. There is no refusing the word of the League.'

'Then I really am a prisoner of the League,' Maxwell returned bitterly. 'Well, the cause of liberty must be in a bad way, when the very members of the League treat brothers as I have been treated.'

'Ah, it is a fine word liberty,' the brigand chief replied sardonically. 'It is a good phrase to put into men's mouths; but there can be no freedom where the shadow of the sword dwells upon the land. Even Italy herself has suffered, as she will again. Perfect liberty and perfect freedom can only be founded upon the doctrine of universal love.'

By this time, Maxwell and the chief had drawn a little aside from the others. The artist looked in his companion's face, and noted the air of sorrow there. It was a fine manly countenance, hanguly and handsome, though the dark eyes were somewhat sombre now. Maxwell, with his cosmopolitan instinct, was drawn towards this man, who had a history written on his brow. 'You, too, have suffered,' he said gently.

'Suffered!' the brigand echoed. 'Yes, Englishman, I have suffered, and not more from the Austrian yoke than the cruelties of my own countrymen. There will be no true liberty here while a stiletto remains in an Italian's belt.'

'I suppose not,' Maxwell mused. 'These Societies seem to me a gigantic farce. Would that I had remained quietly at home, and let empires manage their own affairs. And Salvarini warned me too.'

'Salvarini! What do you know of him?' the chief exclaimed.

'Nothing but what is good and noble, everything to make one proud to call him friend.—Do you know him too?'

'He is my brother,' the chief replied quietly.—'You look surprised to find that a relative of Luigi should pursue such a profession as mine. Yes, he is my brother—the brother of an outlaw, upon whose head a price has been put by the state. I am known to men as Paolo Lucci.'

Maxwell started. The man sitting calmly by his side was the most famous and daring bandit chief of his time. Provinces rang with his fame, and the stories of his dashing exploits resounded far and near. Even away in the distant Apennines, the villagers sat round the winter firesides and discoursed of this man with bated breath, and children trembled in their beds at the mere thought of his name. He laughed scornfully now as he noted Maxwell's startled look.

'I am so very terrible,' he continued, 'that my very name strikes terror to you! Bah! you have been listening to the old women's tales of my atrocities, about the tortures my victims undergo, and the thousand-and-ones lies people are fond of telling about me. I can understand Luigi did not tell you I was his brother; I am not a relative to be proud of.'

'He is in total ignorance of your identity. That I do know.—I wonder at you choosing

such a life,' Maxwell put in boldly. 'With your daring, you would have made fame as a soldier; any path of life you had chosen would have brought you honour; but now?—'

'But now I am an outlaw,' Paulo Salvarini interrupted. 'And why? If you will listen, I will tell you my story in a few words.'

Maxwell threw himself upon the grass by the other's side and composed himself to listen.

'If you will look below you,' the chief commenced, and pointing with his finger across the distant landscape, 'you will see the sun shining upon a house-top. I can see the light reflected from it now. That house was once my home. I like sometimes to sit here and think of those days when Gillana and I were happy there—that is ten years ago now. I had done my best for my country; I had fought for her, and I retired to this peaceful spot with the woman of my heart, to live in peace, as I hoped, for the rest of my life. But the fiend of Liberty was abroad. My wife's father, an aged man, was accused of complicity in political crimes, and one day, when I was absent, they came to arrest him. My wife clung to him, and one of the brutal soldiery struck her down with the butt of his rifle; I came in time to see that, for my blood was on fire, and I did not hesitate. You can understand the rest. My wife was killed, actually murdered by that foul blow. But I had my revenge. When I crossed the threshold of my house, on my flight to the mountains, I left three dead behind me, and another, the officer, wounded sore. He recovered, I afterwards heard; but some day we shall meet.'

He stopped abruptly, shaking in every limb from the violence of his emotion, his sombre eyes turned towards the spot where the sun shone upon the roof-tops of what was once a peaceful homestead.

'Luigi can only guess at this,' the speaker continued. 'To him I have been dead for years; indeed, I do not know what makes me tell you now, only that you surprised me, and I like to hear a little news of him.'

'I have heard this history before,' Maxwell observed. 'It is five years ago now; but I am not likely to forget it. Still, you cannot enjoy this life. It is wild and exciting, no doubt; but your companions?—'

'I live for revenge,' Salvarini exclaimed sternly. 'I am waiting to meet the brutal officer who ordered his follower to strike down my wife. I have waited long; but the time will come at length, and then, heaven help the man called Hector le Gautier!'

'Le Gautier!' Maxwell exclaimed. 'He, an Italian officer! Why, he is at present Head Centre of the Brotherhood in London. He and your brethren are bosom friends. He was even present at the time when Luigi told us your sad history. Surely he cannot know; and yet I trusted him too. Signor Salvarini, you bewilder me.'

The outlaw laughed loud and long; but the mirth was strained, and jarred harshly upon the listener. 'And that fiend is a friend of Luigi's! Strange things happen in these times. Beware, Signor Maxwell—beware of that man, for he will work you mischief yet. It was by his orders you were arrested. He knows me by

name, and as one of the Brotherhood only, so I did his hiding.'

'Strange! And yet I have done him no harm.' 'Not that you are aware of, perhaps. Still, no doubt you have crossed his path in some way. If I have a command in the morning to lead you out yonder to face a dozen rifles, I shall not be surprised.'

'And you would countenance such murder?'

'This morning, yes. Now, I am doubtful. You are my brother's friend; I am Le Gautier's enemy; I do not wish to help him.'

Three days passed uneventfully by, at the end of which time Maxwell had become a great favourite with the outlaw band. Following the lead of their chief, they treated him with every kindness; nor was he in his turn inclined to resent his captivity or chafe at this delay. His chief fear was for Enid; for Paulo Salvarini, though he was inclined to allow his prisoner every latitude, was firm upon the point of communication with the outer world; for, as he pointed out, he might after all be guilty of some great treachery to the League, and in that case must be answerable for anything that happened.

So the days passed on in that quiet spot, no further news coming to him till the morning of the fourth day. Then he was sitting at the door of his hut, watching the sunrise glowing on the distant hills, when Salvarini approached him, his face perturbed, and his whole manner agitated. 'You are in danger,' he whispered. 'The orders have come, and you are proclaimed traitor. The men are mad against you, and declare you shall be brought out for instant execution. Ah! you have only seen the best side of their character; you have not seen them hungry for blood.'

'Do they want to murder me?' Maxwell exclaimed. 'Cannot you?'

'I am powerless now,' Salvarini interrupted. 'I will do what I can; but I fear nothing can save you now.'

'Do not be afraid,' said a calm voice behind. 'I shall save him!'

'Isodore!'

'Yes, Paulo Lucci; it is I.'

Maxwell looked up, and saw the most beautiful woman he had ever seen in his life. For a moment he could only gaze in rapt astonishment. This, then, was the Empress of the League—the woman Visci had mentioned, whose lightest word could free his feet and clear his path for ever.

'You have come in time,' Salvarini said with a low obeisance. 'An hour hence and our prisoner would have been no more.'

'I am always in time,' Isodore replied quietly. 'I have come to deliver you from a great danger,' she continued, turning to Maxwell. 'Come, was must he in Rome at once, and away, or was may yet be too late. Hark! Are the wolves clamouring for their prey already? We shall see.'

It was light now, and from the plateau beyond came the hoarse yells and cries for revenge from the brigands. On they came towards the hut, clamouring for blood, and mad with the heat of passion. They rushed in, seized Maxwell, and led him out on to the level grass, while six of the party stepped back a few paces and cocked their rifles. The whole thing was so sudden that

Lucci and Isodore were totally unprepared to resist. But the girl roused herself now, and quitting the hut, swept across the open space and placed herself in front of Maxwell.

'Drop your arms!' she cried. 'Are you mad, that you do this thing? Ground your rifles, or you shall pay dearly for this indignity.'

Appalled by her gestures and the dignity of her voice, the desperadoes hesitated for a moment, and then one, more daring than the rest, raised his carbine to the shoulder, standing in the act of firing.

'You may fire,' Isodore cried. 'Fire! and every hair of my head shall be avenged for by a life! Fire! and then pray for the mercy of heaven, for you shall not meet with any from the hand of man!'

The desperate men were amazed by this beauty and daring, the audacity of which appealed to their rude instinct. One by one they dropped their firearms, and stood looking sullenly in the direction of the scornful woman, standing there without a particle of fear in her eyes.

'Who are you,' cried one bolder than the rest — 'who are you, that come between us and justice?'

They all took up the cry, and bade her stand aside.

'If she falls, I fall!' Lucci exclaimed in a firm steady voice. 'Go on your knees, and ask for pardon.—Madam,' he continued, falling upon one knee, 'I did not think my followers would have shown such scant courtesy to Isodore.'

At the very mention of her name, a change came over the mutineers. One by one they dropped their firearms, and came forward humbly to implore her forgiveness for their rashness, but she waved them aside.

Long and earnestly the three talked together, listening to the revelation of Le Gautier's treachery, and how the final act was about to be played over there in England: how Le Gautier had confessed his treachery, and how, out of his own mouth, he was going to be convicted. Silently and slowly they wound their way down the mountain path, under Lucci's guidance, out on to the plains, beyond which the sun lighted upon the house-tops of distant Rome. When they had got so far, Isodore held out her hand to the guide. 'Good-bye. It will not be safe for you to come any farther,' she said. 'Rest assured, in the general reckoning your account shall not be forgotten.'

'It will not,' Lucci answered sternly. 'I shall see to that myself. By the time you reach England, I shall be there too.—Nay, do not strive to dissuade me. I do not take my revenge from another hand. I shall run a great risk; but, mark me, when the time comes, I shall be there!'

Without another word he disappeared; and Isodore and Maxwell walked on towards the Eternal City both wrapped in their own thoughts. Mile after mile passed on thus, ere Maxwell broke the silence.

'Do you think he will keep his word?' he said half timidly.

'Who, Lucci? Yes; he will keep his word; nothing but death will prevent that.—And now, you and I must get back to England without a moment's loss of time.'

'I cannot say how grateful I am,' Maxwell

said earnestly. 'If it had not been for your bravery and courage'— He stopped and shuddered; the contemplation of what might have been was horrible.

Isodore smiled a little unsteadily in answer to these words. 'I owe you a debt of gratitude,' she replied. 'My memory serves me well. I was not going to allow you to die, when you would have perished rather than raise a hand against Carlo Visci.'

'Indeed, you only do me justice. I would have died first.'

'I know it; and I thank you for your kindness to him at the last. You were with him when he died. Things could not have been better. He was always fond of you. For that, I am grateful.'

'But I do not understand,' Maxwell faltered. 'He did not know you except by reputation.'

'I think you are mistaken. Am I so changed that you do not recognise your friend Genevieve?'

'Genevieve! You? Am I dreaming?'

'Yes; I am Genevieve; though much changed and altered from those happy old days when you used to come to the Villa Mattio. You wonder why I am here now—why I left my home. Cannot you guess that Le Gautier was at the bottom of it?'

'But he professed not to know you; he'—

'Yes, he professed to be a friend of yours. But until I give you permission to speak, not a word that Isodore and Genevieve are one and the same.'

'My lips are sealed. I leave everything in your hands.'

'And cannot you guess why you have incurred Le Gautier's enmity?—No? Simply, because he aspires to the hand of Enid Charteris.—You need not start,' Isodore continued, laying her hand upon the listener's arm. 'You have no cause for anxiety. It will never be!'

'Never, while I can prevent it!' Maxwell cried warmly.

'It is impossible. He has a wife already.'

Only tarrying for one mournful hour to visit the cemetery where lay Carlo Visci's quiet grave, Isodore and Maxwell made their way, but not together, to England, as fast as steam could carry them.

THE ORDNANCE SURVEY, ITS PAST AND FUTURE.

THE Ordnance Survey is now a hundred years old, and it is expected, according to present arrangements, to be finished in 1890. That, in one sense, is a considerable time to look forward to; but there are several knotty and important questions connected with the completion of this great scientific enterprise which it would be well duly to weigh and consider beforehand. A suitable opportunity for calling attention to the results of this national undertaking is afforded by the publication of a popularly written volume, *The Ordnance Survey of the United Kingdom* (Blackwood & Sons), by Lieutenant-Colonel T. P. White of the Royal Engineers, the executive officer of the Survey. An additional reason for noticing the matter at this stage may also be found in the amount of ignorance which prevails on the subject.

To most persons, the Ordnance Survey only means some kind of measuring of the land; but they have little idea of the methods adopted for the purpose, of the multifarious ends served by the publication of the maps, of the difficulties which had to be overcome, and of the marvellous and unexampled accuracy with which the work has been carried on. There are indeed few things of which as a nation we may feel more proud than the accomplishment of this gigantic work; a noble illustration and monument of persistent perseverance, of infinite ingenuity of resource, and of general engineering skill.

A beginning was made, according to Colonel White, with the primary triangulation for the Survey in 1784 (the Annual Report says 1791), under the charge of General Roy, an able scientific officer, who had been associated with General Watson, thirty-six years before, in a survey of the Highlands made for military reasons, after the crushing of the rebellion of 1745. The idea of a scientific survey of the whole kingdom was first mooted in 1763; but for various reasons, nothing was done till twenty-one years later, when, in response to a proposal from the French government to connect the system of triangulation already existing in France with that about to be set on foot here, the work was at last begun. Hounslow Heath was selected as the base-line of that great system which has now overspread the land. It may not be unnecessary here to remark that the work of a cadastral survey is carried on by a series of triangles proceeding from a base-line—that is, a space of level ground usually about five miles long, which is measured by chain in the most exact manner—this forming the nucleus. From the two ends of this measured space a triangle is formed to some point at a distance, and the length of the two unknown sides computed by trigonometry. From this primary triangle, other triangles are formed, and calculated similarly, until there is a series of these like a network all over the country. Four or five other base-lines were also measured for verifying the correctness of the calculations—hence called 'bases of verification'—notably that on Salisbury Plain, on which as a foundation the principal triangulation of the kingdom was eventually to rest.

It forms a remarkable illustration of the care and exactness with which the work has been done that the lengths of these base-lines calculated from the original one by trigonometry through all the intervening triangles, has been found to coincide within four inches with the lengths as actually measured by chain. A result like this reminds one of the yearly balancing by the system of double entry of the transactions of a great bank with branches all over the country, and where the totals on both sides, amounting to many millions, square to a farthing. These primary triangles, some of them containing sides one hundred miles long, are broken up into smaller ones, and these again subdivided; the latter, with sides from one to two miles, being then measured in the ordinary way by the surveyors. We have thus, from one or two measured spaces—it might be from one only—a triangulation worked out of the whole country, and its area and the relative geographical position of every spot on its surface fixed

for all time. This principal triangulation, as it is called, was completed in 1852. What has been going on since is survey work.

The battle of the scales is another noteworthy point in the history of the Survey. When it was resolved, about the close of the last century, to publish maps based on the triangulation, the scale of one inch to a mile was adopted, and this embraced all England and Wales south of Yorkshire and Lancashire, these two counties being surveyed about 1840 on the six-inch scale, which had been adopted for the Irish Survey, and was now introduced into England. Afterwards, the scale was enlarged to twenty-five inches to a mile, and the four northern counties of England were so surveyed and published. It was then agreed to re-survey all those counties which had been done on the one-inch system. Some of these are completed, while others are still in progress.

In Scotland, the course of the Survey has not run very smoothly. The triangulatory work was begun in 1809, and went on with intermissions till 1823, when it was stopped for fifteen years, to allow the Irish Survey to be taken up. The latter was begun in 1824, and finished in 1842. But six-inch county maps have now been published of the whole of Scotland, one-inch maps of nearly the whole, and those on the twenty-five-inch scale also, with the exception of Middlesbrough, Fife, Haddington, Kinross, Kirkcudbright, Wigton, which had been the earliest surveyed, and were completed before the larger scale was sanctioned. The uncultivated portions of Scotland, it may be added, are also excepted from the larger scale. These six counties, and Yorkshire and Lancashire, are thus the only counties in Great Britain whose maps are not published on the twenty-five-inch scale. Towns with populations over four thousand have been surveyed on a still larger scale, varying from one-five-hundredth, or a hundred and twenty-six inches to the mile, to one-ten-hundred and fifty-sixth, or about sixty inches to the mile. Edinburgh and thirteen other towns are done on the smaller scale, and forty-four other towns on the larger. In any future revision of the Survey, those towns and counties which have not been published on the larger scales will probably have priority.

It is needless to add that great delay and vexatious hindrance to the general efficiency and progress of the Survey have been caused by the vacillation and frequent changes made at the instance of the House of Commons. One session it would be in a liberal mood, and rule that the Survey should be carried on with all speed and on the most liberal scale; and at another it would rescind its good resolutions and pass others of a more economical kind. In 1851, for example, a Committee of the House of Commons, with the present Earl of Wemyss at their head, recommended that the six-inch scale in Scotland should be discontinued and the one-inch maps only published. Much dissatisfaction was felt in Scotland at this retrograde recommendation, and remonstrances from all quarters poured in to the Treasury on the subject. Three years afterwards, the twenty-five-inch scale was approved of; but an adverse vote was carried in the House of Commons two years later; and the question was not put to rest till 1861, when the latter scale was finally

sanctioned; and since then, as Colonel White remarks, 'parliamentary committees have troubled us no more.' A recommendation to accelerate the progress of the Survey was made in 1880; and in the following year the working force was nearly doubled. As a result of this arrangement, it is expected that the work will be completed in 1890; this is on the supposition that the present numbers and organisation are kept up. From the last Annual Report, we learn that on the 31st of December 1885, there were employed 28 officers, 2 warrant-officers, 364 non-commissioned officers and cappers of the Royal Engineers, and 2846 civilians—total, 3240. This, presumably, includes all those connected with the production and publication of the maps at Southampton, the headquarters of the Survey.

Of the inestimable benefit to the nation at large of the Ordnance Survey there can be but one opinion among all persons capable of forming an intelligent opinion. It has proved of great value in a large number of matters of the highest public interest. Its necessity and importance in connection with the national defences are perhaps of primary interest; but there are numerous other departments where it has proved equally essential, such as for valuation purposes—facilitating the taking of the census; for drainage, waterworks, railways, and engineering works generally; for extension of town boundaries, and surveys for various purposes. As a practical example of the public advantage derived from the Ordnance Survey, Colonel White mentions that during the progress of the Redistribution of Seats Bill the enormous number of four hundred and fifty-three thousand maps were required for the Boundary Commissioners; and special duties of a similar kind were also rendered in 1863, and also to the Irish Church Temporalities Commission. These and other services of a more strictly scientific nature, as those rendered to geodesy and geology, afford ample testimony to the value of the labours of those engaged in this arduous and honourable service.

The all-important question remains, how are we to carry on this confessedly important work? We must not lose the benefit of what, through great toil and cost, has been already achieved. Valuable as have been the results, it is evident that many portions of the Survey are now obsolete. The triangulation portion of the work has of course been done once for all; but in a very large number of cases, especially in the suburbs of towns, the whole face of the country is changed. There are hundreds of districts which are presented in the Survey sheets as green fields, surrounded with trees and hedgerows, where now are densely populated towns or parts of towns. The hills and the rivers remain, but all else is changed. Glebe-lands, residential estates, farmsteads have become streets and lanes, or perhaps have succumbed to the operations of the miner, or afforded space for a great industry of some sort. It is obvious, then, that the Survey, unequalled, it is believed, in any other country, should undergo periodical revision in order to keep pace with the progress of the nation, otherwise we shall find ourselves unable to cope satisfactorily with many questions and difficulties arising from time to time in a great country

like our own. How, for instance, would the Boundary Commissioners in the instance already mentioned have performed their duties had there been no accurate survey of the country? And in the war-scare of 1858-9, Colonel White mentions that a great expense was incurred by the government of the day in getting special surveys of large districts hastily made, as at that time the twenty-five-inch scale was just begun; and it would have been still more had there been no force ready to undertake the duty. Imperfectly, then, as the case has been here stated, there is sufficient, we think, to demonstrate that there is a strong plea for a deliberate and favourable consideration of this important matter at no distant date.

It only remains to make acknowledgment to Colonel White for the use here made of many of the facts in his interesting volume. To those who feel any interest in the subject, and even to those who do not, his story of the labours of his comrades is worthy, in literary and other respects, of all commendation, and we venture to say will do much to popularise the subject.

WANTED, A CLUE.

IN TWO CHAPTERS.—CHAP. I.

“COMPANION required for a Young Lady. Must be cheerful, musical, and of good family. Salary, £60 per annum.” Such was the advertisement my aunt Margaret read out to me one morning, as we sat at breakfast in her neat little house in London.

I am the orphan daughter of a missionary, and my aunt's was the only home I had ever known. For the past three years I had been resident governess in a wealthy family in Yorkshire; but my employers' purse-proud arrogance was too much for my self-respect, and I had to leave, resolving if possible to try and obtain a post as companion.

Tempted by the excellent salary offered, I at once wrote to the address indicated. Promptly I received a reply, from Mr Foster of Great Gorton Hall, Westmoreshire. He stated that companionship was required for his step-daughter, Miss Thorndyke, a delicate girl of eighteen, who resided with him and his widowed sister, Mrs Morrell; her mother, his dear late wife, having died the previous year. He added that my acquirements and credentials were satisfactory; and requested to know whether I had ever been in Westmoreshire, and if I had any friends or connections there.

I replied that I was an entire stranger to the county and to all the people in it; and in a few days I was overjoyed at receiving the nomination to the post; for I was unwilling to be a burden on my aunt's slender means.

Gorton Hall was a fine building of gray stone, standing in beautiful grounds, on the outskirts of a pretty country village. I was shown into a spacious drawing-room, where a middle-aged lady in black greeted me very pleasantly, introducing herself as Mrs Morrell. She kindly bade me be seated, and sent a servant in search of her brother.

Mr Foster was a fine-looking man, with iron-gray hair, and a keen and searching expression

—a man whom I instinctively felt it would be dangerous to offend. His manner to me, like his sister's, was courtesy itself. He explained the duties expected from me. ‘And one thing more I must add, Miss Armitage,’ he said in conclusion—‘although willing to concede everything reasonable, there is one thing I cannot permit in members of my household—gossiping with strangers concerning my family. I prefer that my daughter's companion should have no friends or acquaintances in this neighbourhood; and I must request that during your residence here, you discourage any intimacy which people at Gorton or any of the neighbouring villages may seek to establish with you. I have seen so much mischief caused by gossip and tittle-tattle, that I am obliged to request this.’

The stipulation seemed a very reasonable one, and I readily acceded to it. Mr Foster then went on to speak of his step-daughter.

‘Our darling Edith is not so strong as we could wish, and indeed is frequently confined to the sofa. The doctor orders her to keep early hours and avoid all excitement; she therefore goes hut little into society; but we hope the companionship of a bright and lively girl will prove beneficial. Keep her amused and happy, Miss Armitage, and we ask no more from you.’

I found my future charge in the drawing-room, when I descended dressed for dinner. She was a fragile-looking creature, with light hair and large blue eyes. She greeted me very kindly. Her manner was childish, considering her age; but I was much relieved not to find her a fine fashionable young lady. She was still in mourning for her mother.

We had a musical evening. Mrs Morrell and I executed several duets on the piano, accompanied by Mr Foster on the violin, which he played very well. Edith kissed me very kindly as she said good-night; and before I went to rest, I sat down and wrote to my aunt in glowing terms, saying that Gorton Hall was an earthly paradise.

Nor did I see reason to change my opinion for many weeks. I soon felt perfectly at ease in my new home. Edith was so gentle, so unassuming, and so considerate, that it was impossible not to love her; and Mr Foster and his sister were most kind. I was treated as a gentlewoman and an equal; and my duties were very light, being chiefly to drive Edith in a pretty pony-carriage, to play duets, and occasionally to read aloud.

We did not mix very much in society, although Mrs Morrell received a due amount of calls from the ladies in the neighbourhood. A few quiet garden-parties and dinners were the limit of our dissipation, on Edith's account. I was always included in any scheme of pleasure, and Mr Foster made quite a point of introducing me to all visitors.

There was a fine old church in the village, to which we all went on Sundays. It was a mile and a half across the fields; but we usually drove, on account of Edith. I had been nearly six months at the Hall, when one fine Sunday morning in July it fell to my lot to go to church alone, for the first time since my arrival. Mr Foster was in London; Edith had a headache; and Mrs Morrell would not leave her, although

she was urgent that I should go. The service over, I was returning across the first field, when I heard steps behind me, and a gentleman's voice said: 'Miss Armitage!'

I turned round in surprise, to see a young man who was a perfect stranger to me. Lifting his hat politely, he begged for the honour of a few words with me.

I was both amazed and indignant, and somewhat loftily informed him that I was not in the habit of conversing with total strangers; so saying, I was walking on, when he interrupted me, and begged me to listen, for Edith Thorndyke's sake.

'My father, Dr Archer, was her father's oldest friend, Miss Armitage. My family is well known in this neighbourhood; and I live in the next village, Little Gorton, where I am in partnership with Dr Solby. You are well known to me by name, and for some time I have endeavoured to contrive an interview with you, in vain. I could not come up to the Hall,' he added, 'no doubt seeing amazement written on my face. The fact is, Miss Armitage, I love Edith Thorndyke; but her step-father considers my position inferior to hers, and refuses to allow me to see her until she is of age. Doubtless you are aware that she will inherit a great deal of property.'

'I strongly disapprove of discussing these family matters with a total stranger, sir,' I said, trying to move away. 'Also, Mr Foster has absolutely forbidden it.—Good-morning.'

'One moment!' he pleaded. 'Edith Thorndyke's very life may depend upon it! Have you heard the terms of her mother's will?'

'They are nothing to me, sir.'

'Oh, but please, Miss Armitage! I entreat you! Do listen to me! When Mrs Foster's first husband died, he left her some thousand's a year, in addition to Gorton Hall and the estates, entirely at her own disposal. She married again, and died last year, when it was found that she had left her husband Edith's sole guardian until she should be twenty-one, when she would enter into the possession of the Thorndyke property. In case she died before attaining her majority, one half of the property would devolve upon Mr Foster, and half upon relatives of the Thorndykes. Even the half is a very large sum, Miss Armitage—quite enough to tempt a man like Mr Foster to—to— In short, I sadly fear Edith Thorndyke will not be allowed to live until she is twenty-one.'

'This is downright madness!' I exclaimed. 'Mr Foster is the kindest and best of men—quite incapable of harbouring designs upon his step-daughter's life.'

'I know Lawrence Foster; you do not,' he answered quietly. 'I know him to be bold and cunning and unscrupulous. Edith believes in him and his sister; but she is sadly deceived. I hoped to be able to enlist you on my side, Miss Armitage, when I heard of your arrival at the Hall. I should be glad to feel sure that Edith has one disinterested friend in the house.'

'But I ought not to speak to you at all,' I said, feeling very uncomfortable. 'Mr Foster has strictly forbidden me to gossip with strangers.'

'Because he is afraid that you might hear the truth.'

'But if he is what you say, why does he have

a companion for his step-daughter at all? I must be a check on his movements. I see all that goes on; he never hides anything from me.'

'Don't you see that your presence is an additional security for him? It disarms suspicion. Supposing Edith—well, died suddenly; people would say: "Miss Armitage was there; she knows all about it;" and no comment would be excited; whereas it would probably seem suspicious, at all events to the Thorndyke family, who are by no means satisfied with the terms of the will, if Edith were to die whilst living alone with Mr Foster and his sister. There can be no doubt that the money must be an immense temptation to him. He has nothing of his own. Ten thousand a year, and only one fragile girl's life in the way!'

I must say the speaker's earnestness and unmistakable sincerity began to make an impression upon me. I had fancied once or twice that Mr Foster exercised an unusually close surveillance over Edith and me. Were Dr Archer's words true, and was I merely a lay-figure at Gorton Hall, to deceive the world? Had I been taken into society by my employers, and my praises trumpeted forth to all their acquaintances, merely in order that my presence should disarm suspicion? 'You have made me very uncomfortable,' I candidly confessed.

'Believe me, Miss Armitage, I would not have taken this course but that I was compelled by necessity. Edith's step-father has such a complete ascendancy over her, that it is difficult to know what to do. But you are always with her, and can watch over her.'

'But I am only a paid companion, liable to dismissal at any time.'

'True; but I hope you will try and stay as long as you can, for Edith's sake.'

'I fear she is very delicate.'

'She is delicate; she needs care. But, as she gets older, her health will probably improve. There is really no reason, humanly speaking, why she should not live for many years. But I fear—I fear many things, but chiefly poison, slow and secret. Mr Foster is an accomplished chemist; and his antecedents—better known to me than to most people—give me little confidence in him. If you knew as much as I do about him, Miss Armitage, you would not wonder at my suspicions. But be sure of this: there is danger. I have no proof against Mr Foster, and therefore cannot interfere in any way. Promise, promise me, Miss Armitage, that you will inform me of everything suspicious that you may see from this time. Here is my address.'

I hastily took the proffered card and gave the promise, anxious to return before Mrs Morrell should be uneasy at my absence. She laughingly remarked that the sermon must have been unusually long, and in a casual manner asked what was the text. Luckily, I was able to supply chapter and verse and a lengthy catalogue of my fellow-worshippers. It then struck me for the first time that if, by chance, I was allowed to go out alone, either Mr Foster or Mrs Morrell might find out, by skilfully put questions, everything I had said, seen, and done.

Now that suspicion had once entered my mind, I saw grounds for it everywhere, as might have been expected. The most absurd fancies entered

into my head. I persuaded Edith in secret to lock her door at night before retiring to rest, which she had never done before. I do not know what I expected to happen. The precaution was a senseless one; for the foes I was fighting against were far too clever and subtle to contemplate anything so foolish as commonplace midnight murder.

I will do my employers the justice to say that with all this I spent a delightful summer. They took Edith and me to Scotland for a two months' tour; and I never enjoyed a holiday so much. A more charming cicerone than Mr Foster could not be. Then we went back to Gorton, and settled down for the winter. For some time, absolutely nothing of any importance occurred. I wrote occasionally a brief, reassuring, cautious note to Dr Archer, but carefully refrained from speaking when we met, to avert suspicion. Edith and I grew daily more attached; and nothing could exceed my employers' kindness.

Edith had been decidedly better in health, until she received a severe chill in November. Mrs Morrell at once sent for the doctor, the same old family practitioner who had attended her from her birth.

Dr Stevens was a worthy man, and once a skillful physician, no doubt; but when I saw him, he was nearly eighty and quite past his work. Feeble, weak in sight and hearing, the old man seemed more fit to be in bed himself, than to be employed in his professional capacity. I hinted as much to Edith; but she was quite indignant, and reiterated her assurances that she had more confidence in Dr Stevens than in any one else; so I had to rest satisfied.

Miss Thorndyke's illness dragged on with fluctuating strength. She was too delicate to shake off anything easily; and she had frequent relapses, which sadly weakened her strength. Mrs Morrell nursed her most assiduously, declining professional attendance, but permitting me to help her to the best of my ability. But although I was allowed to be in the invalid's room all day, if I chose, Mrs Morrell would not permit me to exhaust my strength in night-nursing. She had had her bed placed in a dressing-room communicating with Edith's room, and there she slept, ready, at the slightest movement of the invalid, to spring up and wait upon her. Edith spoke warmly of Mrs Morrell's kindness and devotion; and certainly she spared no pains to humour the fancies of the sick girl.

About Christmas, the disease assumed a new phase. Symptoms of stomach derangement set in, which Dr Stevens attributed to the long-continued recumbent position and lack of exercise; and he set himself to combat the new evil by every means in his power. This was all discussed in my presence, for no mystery was made of the matter; and indeed I was usually accustomed to administer Edith's food and medicines when I sat in her room. This, however, never occurred in the evening; for Mr Foster so pathetically pleaded his loneliness in the deserted drawing-room after dinner, when his sister always went to the invalid, that in common civility I could not refuse to play chess and cribbage with him, and occasionally accompany his violin on the piano.

But one night about nine o'clock I slipped quietly out of the drawing-room, and went up-

stairs to Edith's room to see if she was awake. She had been worse that day, and I was beginning to feel rather anxious about her. For a wonder, Mrs Morrell was not on duty, and I entered unchallenged. I had not been into Edith's room so late as this since the beginning of her illness, and was astonished to find it lighted up by eight large wax candles, dispersed about the apartment, although the glare was carefully screened from the invalid's face. I stooped over the thin face on the pillow, and received a faint smile. I could not help remarking: 'How light your room is! I wonder you can sleep in such a blaze.'

'Mrs Morrell likes it,' was the languid answer. 'She always burns eight candles like that, all night. I don't mind them.—O Alice dear, I am so tired of lying here! and I'm always so thirsty, so dreadfully thirsty! Do give me something to drink!'

I poured out a tumblerful of a cooling drink from a handsome red glass jug on the table near me. She drank it eagerly, and sank back on her pillow as Mrs Morrell came into the room.

I fancied that an angry gleam shot at me from under the widow's black eyebrows; but if so, she smoothed away her irritation before she addressed me. 'Alice, my dear, it is most kind of you to be here, but I left my darling girl, as I hoped, to sleep. She is more likely to get a good night's rest, if she is not disturbed by late visitors. After nine o'clock, please, I must request you for the present, dear, not to come here again.'

I apologised, and said good-night, turning, however, at the door to ask if Mrs Morrell did not think so much light might have a disturbing effect upon the invalid.

'Now, my dear Miss Armitage, that is not like your usual common-sense,' answered the widow sweetly. 'Above all things, plenty of light is essential in a sickroom, where medicines have to be accurately measured out, and where at any moment the nurse may be summoned to her patient's side. I should be tumbling over the furniture in the dark, if the candles were not kept burning. And now, my dear girl, I must really request that you go; Edith is nearly asleep. Good-night.' So I ran down-stairs, to be gently scolded by Mr Foster for my long absence.

When a week went by and Edith grew worse every day, I became seriously alarmed, and expressed my uneasiness in a letter to Dr Archer, which I posted myself, for fear of accidents. He sent me a brief note by a trusty messenger, in reply, which did not tend to allay my fears:

'Your account of her symptoms was most alarming. You say she is wasted and prostrate, and suffers from painful cramps and insatiable thirst. These are the symptoms of arsenical poisoning. You must contrive to secure portions of all her food and medicine, and bottle them secretly, and bring them to me. Be in the fir plantation at four o'clock to-morrow to meet me; it is a matter of life and death.'

You may imagine how terrified I was; but luckily I had nerve enough to hide it. I looked out all the small bottles I could find, washed them out carefully, and determined to put them into my pocket one at a time, to fill as occasion should serve. At the same time I could hardly believe that Dr Archer was right in his suspicions. I believed they could not poison Edith

without my knowledge. I was in and out of the sickroom all day, from about ten o'clock in the morning, until I was dismissed at five to dress for dinner; and at least half of her food and medicine I administered with my own hands. The medicine bottles I frequently opened fresh from Dr Stevens' wrappings; and it was difficult to imagine that poison could get into puddings and jellies brought straight from the kitchen to the bedside. I could only conclude that at night must occur Mrs Morrell's opportunity—if at all.

I felt like a conspirator, as I contrived to secrete small portions of everything of which Edith partook. I secured the last drops remaining of the cooling drink which Mrs Morrell had had to administer to the invalid during the night; also a portion of the farinaceous pudding which Miss Thorndyke had had for her dinner, a part of her sleeping-draught, a wine-glassful of the mixture she was taking every two hours, and some of the beef-tea which Dr Stevens had ordered for her. If poison were really being administered, it must be present in one or other of these. I chiefly suspected the remains of the cooling drink. I was young and unsophisticated, and my experience as a novel-reader made me believe it quite possible that Mrs Morrell should carry small packets of arsenic about in her pocket, to mix in Edith's medicines and food, as occasion should serve. I can only smile at my credulity now.

It was a difficult matter to meet Dr Archer in the fir plantation unobserved. Mrs Morrell had first to be evaded, and then Mr Foster, who manifested a most amiable and pressing desire to accompany me in my walk. I dared not linger, but hastily thrust the phials into the young doctor's hands, telling him I particularly suspected the cooling-drink. He informed me that he was going to send them at once to an eminent analyst at one of the London hospitals; and that, if they proved to contain poison, he should instantly apply to a magistrate for a warrant.

I could not control my feelings that evening sufficiently well to prevent Mr Foster remarking, as we sat at chess: 'Your walk to-day did not do you much good, Miss Armitage.'

'I have rather a headache,' I hastily answered. It was perfectly true. 'I sat with Edith all the morning, and her room seemed to me very stuffy.' Indeed, I had frequently noticed a strange closeness pervading it, especially when I first entered it in the morning; and I very often found my head the worse for a prolonged sojourn in it.

'As soon as Dr Stevens will allow it, she shall be moved into a larger room,' he answered, as if he wished to evade a discussion of the subject.

SOME ANECDOTES OF AMERICAN CHILDREN.

THE subject of children is one in which every one is more or less interested; for even those who have none of their own were babies themselves in some dim period of the past, and probably most of us have wondered at times what sort of babies we were. Happy they who have it on the authority of those who ought to know, that they were 'well-behaved children'—lumps of good-nature, and never addicted to crying. How kindly does Charles Lamb revert to the

days of his childhood, dwelling with something of reverence on the image of that 'young master' whom he could scarcely believe to have been indeed himself, and whose pure memory he cherished as tenderly 'as if it had been a child of some other house,' and not of his parents. So perhaps some of us also have yearned over those little phantoms of the past, our own child-selves.

But it is of American children that we have now a few words to say. Perhaps, however, we make a mistake at the outset in calling them *children* at all, for many of them seem to belong to some species of fairy changelings, so remarkable and almost uncanny is their precocity, and that, too, from the earliest infancy, while they are still in their nurses' arms, or at the bottle. Gilbert's little urchin of the *Bab Ballads* who chucked his nurse under the chin when she fed him, and vowed by the rap it was excellent pap, was nothing to them. They would be too *blasé* for such infantile manifestations as these. We have one of them before our 'mind's eye' now, an ideal-looking little maid, with sunny hair, blue eyes, and rosy cheeks, the youngest darling of a happy household. Being of a wakeful disposition, she was indulged with her bottle at night up to the mature age of nearly two years. Her mother, waking once at midnight, was aware of some disturbance in the cot beside her, where baby seemed to be searching vigorously in the moonlight for something. Hoping the little one might forego her search and drop to sleep, the mother lay quiet, when suddenly baby raised her soft fair head, and with the startling question, 'Where de debil is my mouf-piece?' fairly banished all slumber from her fond parent. It must be explained that this occurred in a part of the country where children were liable to overhear the talk of negroes, both indoor and outdoor servants; and this race, as represented in the States of America, are evidently of the opinion of the old sea-captain's Scotch wife who, while agreeing with her minister as to the advisability of her husband's giving up the habit of swearing, was yet constrained to acknowledge that 'nae doubt it was still a great set-off to conversation.' Baby's grandmamma, however, on being informed of this last addition to her darling's vocabulary, remarked somewhat grimly that it was about time the bottle should be given up.

The foregoing was scarcely so bad as what a little two-year-old neighbour was guilty of; for on this young scapegrace being mildly remonstrated with for some misdemeanour by his grandfather—a venerable old doctor, of much repute with all who knew him—he retorted, in his half-articulate baby speech, 'Gan-pa, you're a old fool!'—waking a burst of unhalloved merriment from all within hearing distance.

The propensity on the part of their children to use profane language is a source of great uneasiness to American mothers. One lady, the daughter of a clergyman, who had brought her up on strictly old-fashioned principles, was much distressed to note the habit growing on her only child, a fine manly little boy of four years. At her wife's end for a timely cure, she at last resorted to the expedient of a whipping, threatening, with the most unmistakable air of sincerity, that it would be repeated if ever a certain word

were used by him again. The morning after this occurrence, Georgie was, as usual, at his spelling lesson with his mother, the task for the day consisting of a string of words all rhyming with 'am.' The first few of them had been accomplished with praiseworthy accuracy, when suddenly the young edward came to a dead-stop. 'Go on, sonny,' said his mother encouragingly, not seeing for the moment where the difficulty lay. 'C-a-m—cam,' repeated Georgie in evident embarrassment, the next word apparently presenting some insurmountable obstacle. 'Go on!' insisted his mother—when, with a sudden blurt, out came the monosyllable 'D-a-m—dam, a mill-pond dam,' added Georgie, the threatened punishment being uppermost in his mind.

The same little boy had a cousin, a year older than himself, and ages ahead of him in knowledge of the world, so much so, that he would sometimes assume the part of mentor towards his more unsophisticated junior. When the two were together one day, the elder announced his intention of paying a visit to a family living near them. 'But I won't take you with me,' said he. 'Why not?' asked Georgie, disconcerted. 'Because they'll teach you to swear,' returned the other gravely. 'But you go there yourself,' argued little George. 'O yes,' rejoined his senior with a world-worn air; 'I swear already.'

Young America does not take kindly to correction in any form, probably resenting it as an infringement of natural liberties. One little boy having been punished for some childish transgression, astonished his family by coming down suddenly from his room up-stairs with a small bundle under his arm, saying, 'I'm going to leave this blessed house.'

American children are, as a rule, more practical and less imaginative than those of the old country—inclined from the very beginning to look on life as a struggle, though a pleasant one on the whole, and on the world as their oyster, which they, with their sharp-set wits, must open. They bring this matter-of-fact element even into their devotions. A little girl was promised by her father, on his leaving home for a few days, that he would bring dolls for her and her sister when he came back. That night, when at her prayers, she put in the very laudable petition, 'Pray God, bring papa home safely;' but somewhat compromised the effect by adding with great emphasis, after a moment's rapt reflection—'with the dolls.' But this was devotion itself compared with the following. A little mite of a creature running out of her room one morning was called back by her mother: 'Dolly, you haven't said your prayers.' 'I dess Dod tan wait,' returned little Miss Irreverence; 'I see in a hurry.' In both these cases, the utter unconsciousness of presumption on the part of the tiny speakers took away the effect of profanity from their words.

Reverence is certainly not the strong point of our small kinsfolk across the water. Almost from their entrance into the world, they begin to assume airs of equality, with all around them. One sweet little damsel, who was of peculiarly small and fairy-like proportions, could with difficulty be prevailed upon to call her parents otherwise than by their Christian names; and the effect was quaint to hear her, when offered candy or such-like forbidden dainties, refuse them with

a wistful look and the words: 'Willie not likes it' (Willie being her father); or, 'Annie' (her mother) 'said no.' Nay, she did not scruple even to call her grandmother by her name, as far as she could pronounce it, for 'Margaret' offered some obstacles to the baby lips. You would have fancied this same little maiden too soft and gentle to brush the down from a butterfly's wing; but on one occasion she shocked the sensibilities of her young cousin, fresh from England, by exclaiming on an innocent, newly fledged chicken being brought in for the inspection of the family: 'Me have dat pitty bird for my dinner!'

From the youngest age, American children are ready to share—as Wordsworth once expressed it—'in anything going.' A visitor injudiciously offering a little boy some wine at dinner, was requested by his watchful mother not to give him 'too much'; when young Hopeful took the words out of her mouth by protesting with vehement eagerness: 'I like too much!'

It is no easy task to impose any restrictions, even of time or place, on one of these little free-born Americans, or to impress them with any sense of restraint or regard of persons. One little daughter of Eve, brought up for baptism at the ripe age of two—episcopal visits being rare in the part of the country where she lived—somewhat scandalised the bishop by calling his attention, just before the ceremony, to her attire, thus: 'Look at my new dress;' and drawing it back to display her dainty feet—'Look, bissop, at my pitty new boots!' The good father took it all in very amiable part, though he remarked to her mother afterwards, that the little one had evidently no intention of giving up the vanities of the world just yet.

But we must say good-bye for the present to our little American cousins, on whom we must not be understood to have cast the shadow of an aspersion. Their intelligence and quickness, indeed, combined with the other charms of infancy—of which they have their full share—make them as attractive, to say the least, as any of their kind. We can assert, moreover, from our own knowledge, that some of these tiny gentry, with whose scarce-conscious childish profanity we have dallied for a while, are growing up at this present moment into decent and in every way excellent members of society.

A STRANGE LOVE AFFAIR.

HECTOR MACKINNON, the hero of the strange story we are about to unfold, a story perhaps unequalled for uniqueness in the annals of love, was a divinity student. He had just completed his fourth year of the Hall, and expected soon to be licensed as a probationer. He was the only son of a wealthy merchant, and had been destined for the ministry from his birth.

Mr Mackinnon, senior, was a prominent and influential adherent of one of our strictest dissenting bodies, and had brought up his son in the belief that there was little else good in the world outside the pale of its communion. There was some mystery about Hector's mother, who had died shortly after giving him birth. Some people whispered that she had been on the stage before she was married, and that

Mr Mackinnon had fallen violently in love with her pretty face, and married the young girl while in the ecstasy of his passion, and before the cold dictates of prudence, or the counsel of his friends, could intervene. The marriage had not been, it was said, a happy one. While the magic glamour of love lasted, all went well; when it began to wane, the angular austerities of Mr Mackinnon's disposition became painfully apparent to the young bride. On his part, he looked without sympathy, if not indeed with positive contempt, on what he termed the 'worldly frivolities' of her gay and joyous nature. Above all, he felt keenly the loss of social status which the marriage entailed on him in the estimation of his own sect. The young wife was sternly forbidden to have any intercourse with her relatives and friends; and her husband's sister, who was a maiden lady of very gloomy religious views, was installed as housekeeper ostensibly, but really to play 'propriety' to her unregenerate young relative. Happiness could not, of course, exist in this state of matters; and when the grim messenger arrived with the fiat which dissolved the ill-assorted union, it was perhaps a relief to all.

Brought up under a terribly severe code of social ethics, the theatre, concert, and ballroom were represented to Hector as only so many roads to perdition; and being of an amiable disposition, and desirous of pleasing his father, he had up till now, when he had attained his twenty-third year, sedulously eschewed these enticing forms of social amusement. It was not destined, however, that he was always to remain in this state of innocent ignorance. A brilliant theatrical star visited the city, and turned the heads of all—both young and old, male and female, alike. Her stage-name was Violet d'Esterre (no one knew her real name), and it was on her exquisite delineation of Shakspearean tragedy that her justly earned fame rested. The college students were particularly enthusiastic in her praise, and crowded the theatre nightly to admire her beauty, and listen entranced to the melody of her sublime elocution. One evening, Hector, persuaded by his companions, consented to accompany them to hear this paragon of passionate declamation. The play was the old, old story of the hapless lovers of Verona. Such a hold had her impersonation of the intensely loving Juliet taken of the public, that they insisted on it being performed night after night, to the exclusion of other tragic parts in which she was equally celebrated. If any of our readers have not been in a theatre until they were about the age of Hector, they will be able to realise the very powerful sensuous effect the music, beautiful scenery, bright dresses, and decorations had on his imagination, and how they conduced to give full effect to the sense of bewildered admiration he felt when the curtain rose on the banquetting hall in Capulet's house, and the fair daughter of Capulet. How festively, it seemed to him, did Romeo express his feelings in saying:

O, she doth teach the torches to burn bright!
It seems she hangs upon the cheek of night
Like a rich jewel in an Ethiop's ear:
Beauty too rich for use, for earth too dear!

Mademoiselle d'Esterre's physical qualifications for the part were superb. Her countenance, which was Italian in cast of features and complexion, boasted of a pair of orbs of the deepest violet black. Large and lustrous, they were mobile and expressive in the highest degree. When they first rested on Romeo's form, they dilated with the eager fire of southern passion, and as quickly drooped in maidenly confusion and modesty. Her whole attitude showed she felt she had met her destiny; and before she had even spoken a syllable, the audience felt they were under the spell of an enchantress. Then, with what simple natural dignity did she invest the few words the girl-lover addresses to love-stricken Romeo, already commencing his love-making as 'holy palmer.' From the moment the curtain was raised until it descended at the end of the fifth act, Hector sat spellbound, oblivious to everything on earth save the scenes that were being enacted on the stage. His companions had to arouse him when it became time to quit the theatre.

'Well, Mackinnon,' said Charley Smith, 'what do you think of the d'Esterre? Jolly-like girl, isn't she?'

'Don't speak of the young lady in that vulgar way,' he replied. 'I am certain that girl is as pure and good as Juliet was.'

'I am not saying a word against her—nobody can do that,' his companion rejoined. 'Surely, surely, you've not got hit with her charms—you, of all men!'

Hector was in no mood for badinage at that moment, and pleading a headache, he hurried off to his lodgings. He could not imagine what was the matter; but after tossing all night uneasily in bed, he had to confess to himself next morning that he, Hector Mackinnon, the budding clergyman, the lifelong hater of things theatrical and bohemianisms of every sort, had fallen hopelessly and irrevocably in love with an actress he had seen for the first and only time a few hours ago! There was no use in trying to disguise the truth to himself; he felt—or fancied he felt, which comes to much the same thing—that life without possession of this fair divinity would not be worth living; but that, with her by his side, the roughest tempests that fate could send would feel like gentle wooing zephyrs.

It was not to be expected that this state of matters could long remain secret from Hector's companions. His theses and themes remained unwritten; his answers to the Professor's questions were of the most incoherent description, and at last he discontinued his attendance at college altogether. Inheriting a considerable share of his father's stern determination, he was not of a nature to suffer in silence the agonies of a secret and unrequited passion. The inspirer of the consuming yet delicious flame which burned within his bosom must, he admitted, be some few years older than himself; for had she not been a celebrity in her profession for over a dozen years now? Well, what of that? Was that any reason why he should deny himself the lifelong companionship of the only woman he ever loved or could love? To marry her meant, he knew, an open rupture with his father, and the abandonment of his ministerial career; but were these

trifles for one moment to be weighed in the balance against the pure and unalloyed bliss of a lifetime spent in the society of his darling? No—a thousand times, no! In this wise did he reason with himself, as many a lover has done before, and, we may safely predict, will do again. His life had now only one object, and that was to gain an introduction to Mademoiselle d'Esterre, and press his suit with all the ardour of a lover who felt that his life's happiness depended on the result.

Every night found him at the theatre, gazing on the unconscious cause of his distraction 'till his life's love left him through his eyes.' The rich clear notes of her magnificent contralto voice seemed to flood the theatre with the music of the spheres, and filled his soul with an agony of delight. At this period, it would have been an unspeakable relief to his overcharged feelings, if he had had some sympathetic friend to make a confidant of. But, alas, the sufferer from the darts of the rosy god, like the victim of prosaic toothache, obtains no sympathy from his kind.

Time wore on, and the posters announced the last six nights of Mademoiselle's engagement. He had tried his best to procure an introduction, but without success, the friends and associates of his past life being widely outside of theatrical circles. He found out, however, where she lodged, and the hour at which she usually took her daily promenade. In vain did he follow her at a respectful distance, in the fond hope that some drunk man, runaway horse, or other street casualty, might afford the means of an impromptu introduction; unfortunately, the pedestrians were all sober, and the horses jogged on in a manner remarkably sedate and correct. At last, when almost reduced to despair, an ingenious thought occurred to him. The talented actress occasionally gave morning recitations and readings. He was possessed of considerable literary ability, and what was to hinder him from composing a suitable piece for recitation, sending it to her for approval, and by that means obtaining a personal interview? Being favourably impressed with the feasibility of the scheme, he set to work, and composed a hundred-line poem in blank verse, in which the torments of unrequited love were very forcibly if not elegantly portrayed. With a trembling hand, he dropped this in the letter-box, accompanied by a polite note craving her acceptance of the offering.

Who shall attempt to describe the thirty-six dreary hours of suspense that elapsed before a reply came, in a polite little epistle redolent of patchouli, thanking Mr Mackinnon for his kind present, which she would be glad to use on the first suitable occasion? She was, however, of opinion that, from an elocutionary point of view, certain alterations would tend to make it much more effective. Would Mr Mackinnon honour Mademoiselle by calling on her at her residence, at noon the following day, when said alterations could be discussed? The poor fellow almost cried as he again and again pressed the precious missive to his lips; and it was some time before his spirits were sufficiently calmed down to admit of his inditing a coherent reply. Hope now lent her rosate

hues to our hero's love prospects, and it was with difficulty he compelled himself to await the slow progress of the hands on the dial of his watch till they were conjoined over the happy hour appointed for his interview with her, who held his life's happiness at her sole command.

Arrived at his destination, he timidly rang the door-bell, and on giving the servant his card, was informed the lady was 'at home.' On entering the drawing-room, he beheld Mademoiselle reclining in a graceful attitude on a low ottoman. She wore a *négligé* costume of some sort of soft warm cream-coloured material, which harmonised delightfully with her clear, transparent olive complexion, and displayed the symmetry of her exquisitely formed figure to great advantage. She wore no jewelry; her only ornament was a beautiful Marshal M'Mahon rose, the deep crimson petals of which formed a charming contrast to the raven tresses on which they reposed. There were two other occupants of the room; and it was easy to see, from their 'at-home' air, that they were not merely visitors. One was a brisk little lady, with a pleasant good-humoured expression, who it would be safe to guess had seen at least fifty summers. The other was a tall stately girl of not more than seventeen or eighteen. She had evidently been practising at the piano, which lay open, with the score of a new opera on the music-holder. Had Hector's mind not been so fully engrossed, he probably would have noticed a considerable resemblance between her and the fair object of his devotions. The principal difference lay in the colour of the hair, the complexion, and the stature. The young lady was a pronounced blonde, possessing large azure orbs of almost dreamy softness, and a wealth of light reddish-golden hair carelessly twisted and fastened in a coil at the back of the head.

As Hector advanced, Mademoiselle rose gracefully from her seat and, glancing at his card, said in the same rich contralto tones which had so enthralled him in the theatre: 'Ah, Mr Mackinnon, I perceive! Good-morning, sir. Pray, be seated.' Holding out her hand, he had the brief precious delight of pressing it for a second in his trembling palm.—'Now, you needn't leave the room,' she said, addressing her two companions. 'This is the gentleman who did me the honour of sending me the poem entitled *Amor in Mora*.—Permit me to introduce you to my good friend Mrs Eskell; and to Mademoiselle Andresen, my niece.'

The introductions being over, Hector resumed his seat. He never felt so embarrassed in the whole course of his life. How fondly had he rehearsed in his mind the many brilliant tender speeches he would give utterance to on this occasion! Now that the wished-for opportunity had arrived, he sat speechless. It is but fair to say, however, that he did not contemplate the presence of third parties at the interview. Still, their presence should not have tongue-tied him as it did—he, the glibest debater and the best elocutionist in the college.

Seeing his embarrassment, the lady came to his relief. 'Well, Mr Mackinnon, I am very much pleased with your poem, and I think, with a few slight alterations, it might make a very effective recitation. Do you not think, though,

the title is a little too lugubrious? Could you not substitute some other word for *Mors*? Just reflect! Fancy me dying every night for the past fortnight as Juliet! It is really too bad of the good folks of your city to insist on my manager making me repeat night after night a part which I have begun really to detest.

'O Mademoiselle, do not say that,' cried Hector. 'Ah, if you but knew the delightful thrill you send through the audience in the balcony scene—and—and—the tears you cause them to shed when the unfortunate heroine—Shakespeare's greatest creation!—'

'Shakespeare's greatest fiddlestick!' she replied, laughing merrily. 'What people see in her, I'm sure I don't know! To my mind, she's a forward young dolt, that would have been much better employed in mending Papa Capulet's hose and helping her mother to keep house, than philandering with her Romeo.—But about *Amor in Mors*. Don't you think, now, you could make it just the tiniest little bit funny? I do so long to get out of this continued round of love-making, murder, and suicide.'

Could he believe his ears? Was this cynical, matter-of-fact woman identical with the fair embodiment of transcendental, ethereal love, on whose accents he had hung with enraptured delight for the past few nights? No, it could not be; there must be some strange mistake. Yet, when her mobile features were for a moment in repose, there he beheld the same deep, lustrous, unfathomable eyes—the same sweet innocent mouth, with its half-childlike pouting lips. He was bewildered, and as in a dream.

'You are plesed, Mademoiselle, to be satirical this morning,' he replied. 'I cannot do you the injustice of supposing you are in earnest in what you say. No one could enact the part of Juliet so nobly unless she were capable of imbuing herself thoroughly with the divine passion attributed to her by her creator.'

'Believe me, you are quite wrong there, Mr Mackinnon. It is not by any means those parts which actors have the natural emotional qualifications for, that they excel in portraying. Nature in that case destroys art; and hence it is that parts that actors like best are precisely those they act worst. For myself, I am guided entirely by public criticism, and confine myself to those rôles that draw the best houses. Of course I have my own predilections. I have a very fair singing voice, and think I should be able to do very well in opera-bouffe. Oh, I do dote on opera-bouffe!—But about *Amor in Mors*. I really think the language is splendid—quite as good as Shakespeare's, I daresay, although I don't profess to be a literary critic. Well, if you would alter the conclusion in such a way as to make the audience take a good hearty laugh after I had wound them up to the crying pitch, I believe it would be effective, and I will line it in the hills for my first Saturday morning readings.'

'Alas, Mademoiselle, I fear my poor verses are not susceptible of being changed in the way you wish; but if you allow me, I shall endeavour to write something in a lighter vein, that may have the happiness to merit your approval. Permit me to ask you to retain the verses you have.'

'With pleasure, sir,' she replied.—'I presume you are of the literary profession?'

Hector was not very sure whether a divinity student came of right under that category or not, but he replied in the affirmative.

'Well, then, we shall be glad to see you, if you can come along here to supper at twelve o'clock on Friday first. It is a farewell entertainment I am giving to a few friends of the press, and others. If you have your new piece done, bring it with you; I'll recite it, and we'll see what they think of it.' Thus saying, she rose, as if to indicate the interview was at an end; and after making his adieu, Hector departed in a very anomalous state of mind. The bright, girlish, gushing Juliet of the foot-lights was for ever annihilated in his mind. In her stead stood an undeniably handsome, accomplished woman of the world, gay, good-humoured, and apparently good-hearted; but so utterly devoid of all sentiment as to frankly avow a longing for opera-bouffe! By all the rules of common-sense, our hero being disillusioned, should have at once fallen out of love. This, however, did not happen. After the first shock of finding her so different in her ideas from what he expected was over, the subjectivity of his passion asserted itself, and his mind soon formed a fresh ideal of female perfection, of which she was again the incarnation.

He had but two days in which to compose his second recitation. Striking a new chord, he wrote it in a light cynical vein, such as he thought would please the fair actress, judging from her conversation with him. He wrought hard at it, polishing and repolishing every line, until it reached, as he thought, as near as possible to a state of brilliant perfection. When the eventful Friday night arrived, he started for Mademoiselle's residence with a much greater feeling of confidence than he had experienced on the former occasion. He was the first arrival, and while he sat in the drawing-room, Mademoiselle Andersen and Mrs Eskell entered. On his first visit, he had not paid much attention to the appearance of the former, and he was almost surprised to see how exceedingly pretty she was. The old lady was very talkative, and was not long in making him aware she was a distant relative of Mademoiselle's, and always played 'Nurse' to her Juliet. Mademoiselle Andersen, whose father was a celebrated violinist in Stockholm, had just completed her course of training for the lyric stage at the Conservatoire, and was now on a visit to her aunt, to benefit by her instructions in the technicalities of stage business. On being invited by Hector, the young lady sat down to the piano, and sang an exquisite Danish ballad, which fairly charmed him. The company now began to arrive, and he conducted the two ladies down to the supper-room.

Exceedingly pretty, and exceedingly happy too, did Mademoiselle d'Esteroo look, as she sat at the head of the table listening to the cheerful conversation of her guests. There were not more than a dozen and a half present—four ladies and four gentlemen of them being members of Mademoiselle's company. After supper, and a due period of vivacity over the wine, the fair hostess called for silence, and intimated her intention of reciting Mr Mackinnon's new poem. The author felt himself blushing to the tips of his ears as he heard the—to him—familiar lines

tripped off in her melodious voice with rare elocutionary art. At the conclusion, the applause was great; and the gentlemen of the press declared with one voice it was the best thing of the season, and that the author would be sure to make his mark if he applied himself to dramatic literature. With toast and song the hours sped pleasantly away till two o'clock, when the cabs began to arrive for the guests. Hector had been all night in brilliant spirits, and fairly astonished himself with the smartness of his witty repartees, and the ease with which he accommodated himself to society so different from that to which he had been accustomed. His intoxication of his reached its climax when, as the dispersing company were singing *Auld Langsyne* in the lobby, his hostess whispered in his ear: 'Wait; I wish to speak with you. Go up to the drawing-room.'

He did so, and awaited her coming with trembling, eager impatience. When she came into the room, she looked grave, even sad, he thought. 'We may never see each other again, Mr Mackinnon, and I cannot think of letting you go away to-night without some recompense for the pretty poem you wrote for me. Pray, accept of this in recognition of it, and—and as a token of my regard for you,' and she handed him a magnificent cluster diamond ring.

His head swam; he scarcely knew what he was doing, and fell on his knees before her.

'O Mademoiselle!' he cried, his voice hoarse with emotion, 'you are an angel!—infinitely too good for me—too good for any one on earth. Oh, how can I dare look in your sweet face and utter the words which burn on my tongue! Forgive me for my presumption in daring to say so, but I love you—love you with my whole heart and soul. Dare I ask you to be my wife!'

Mademoiselle d'Esterre at first looked frightened, thinking her friend had taken leave of his senses, or was giving her a small sample of his histrionic powers. When he had made an end of his speech, however, she apparently could not help bursting into an immoderate fit of laughter.

'Rise up, you silly fellow!' she cried, 'and don't make a baby of yourself.'

Her suppliant, who was in a state of bewilderment, mechanically obeyed.

She continued: 'Upon my word, Mr Mackinnon, you have paid a great compliment to my skill in preserving my looks. Why, my poor boy, I could easily be your mother! I was forty-three on my last birthday!'

It might have been expected that this astounding piece of information would have effectually quenched the flame in the breast of the unfortunate lover, yet it had not that effect. 'Alas! Mademoiselle, I am sorry that the disparity in our years is so great, although I knew you must be a few years older than myself. But what is age where true love exists? Believe me, if you consent to our union, never will you hear me refer to the dis—'

'Stop, stop, you foolish boy!' the lady cried. 'Even were I such a terrible fool as you suppose, there is an insuperable legal obstacle in the way.'

'What is that?' he asked, wondering.

'Why, I'm your aunt!' she replied. 'My sister Agatha was married to your father!'

The mortification experienced by our hero, in consequence of the ludicrous incident we have described, was extreme, and it was a few weeks before his mind recovered its accustomed equanimity. When it did, he resumed his college studies; but from the time lost, and the still partially unsettled state of his mind, he failed to pass his examination, and gave up his intention of qualifying for the ministry in disgust. His aunt's company soon paid another visit to the city, and she advised him to try 'adapting' French plays. He was tolerably successful in this, and by her influence, was able to get them placed with some of the London managers. He then determined to devote himself entirely to dramatic literature, and being much thrown into the company of his fair cousin, Miss Andersen, a mutual affection grew up between them, which culminated in marriage. We understand they live very happily, although his wife does sometimes joke him on his love-adventure with his aunt.

MEHALAH.

[This poem is written on the chief character in the novel of the same name.]

SLEEP on, Mehalah; let the rude waves beat
Their sullen music in thy deafened ear;
Whether they roar in storm, or whisper peace,
Thou canst not hear.

What matter though the gale in fury rave!
Beneath the surface, all is calm and fair;
Held close by flowers too beauteous for the day,
Thou slumberest there.

Unseen by mortal eye, the ocean sprites
Vie who shall deck thy form with fairest grace,
And many a sea-born flower and waving weed
Adorn thy face.

But when the shadows of descending day
Gleam on the marsh, and fire the western sea,
Thy spirit 'scapes the chains that bind it down,
And rises free.

As vesper chimes grow dimmer and more faint,
And sink to silence, conquered by the storm,
The fishers, hast'ning home to those they love,
Behold thy form,

Thy face so proud, thine eyes so dim and sad,
Thy hair unsackled streaming towards the west,
The crimson 'Gloriana' burning bright
Upon thy breast.

But as they gaze, the vision fades away,
Dragged to the depths by iron hand and chain;
Thy seaweed shrieks, and darkness o'er the world
Resumes its reign.

INN-SIGNS—THEIR ORIGIN AND MEANINGS.

IN these days of enlightenment, the signs displayed by our inns, taverns, and public-houses are not matters of great or urgent importance to us in the ordinary routine of our daily life. But in times past the case was widely different. For several centuries at least, signs and signboards were matters not only of convenience, but even of necessity. During this time they played a by no means unimportant part in the busy world of trade and commerce, and were of great service to mankind in general in a way they are no longer capable of being. Under these circumstances, it will be easily understood that they gathered around them no small amount of interest, not only of a commercial, but also of a domestic, and even of an historical kind. Many, even of our modern inn-signs, are able to speak instructively to those who trouble to decipher their now somewhat indistinct and illegible meanings. They tell us of the customs of our forefathers, of the superstitious beliefs they held, of the wares they made and dealt in, and of the party strifes in which they engaged. They speak to us also of the great men who had so large a share in the making of English history in bygone times, and are able in many other ways to remind us of the pursuits, the pleasures, the manners, and the customs of our ancestors. It will therefore be worth while to devote some attention to the subject of our modern inn-signs, especially as comparatively little has hitherto been written about them.

The use of signs as a means of distinguishing different houses of business is a custom which has come down to us from times of great antiquity; nevertheless, it is not now at all difficult to discover the reasons which first led to their being employed. During the last and preceding centuries, only an infinitesimally small proportion of the people was able to read and write. In those times it would obviously have been useless for any tradesman to have inscribed his name

and occupation, or the number of his house, over his door, as is now done. The words 'W. & R. Chambers, Publishers,' would then have conveyed very little meaning, or none at all, to the popular mind. But if each tradesman suspended before his house some easily recognisable device of a pictorial nature, the case would obviously have been different. If the sign thus displayed indicated the nature of the wares sold within, it would answer a double purpose; but in any case, it would serve to mark the particular house displaying it. Signs, too, would be especially useful in distinguishing different establishments in times when many members of the same craft dwelt together in a particular street or quarter. This they used formerly to do, very much more than now; and in the various large cities of the East the custom still to a great extent survives.

In speaking of the origin of the use of signs, it must never be forgotten that in past times they were not confined, as now, almost exclusively to 'public-houses.' We have still the sign of the Pole for a barber, the Black Boy for a tobacconist, the Rod and Fish for a tackle-dealer, the Golden Balls for a pawnbroker, and some others; but formerly, almost all houses of business displayed their signs, just as inns and taverns do now. Evidence of this fact is afforded by the imprint of almost any old book published in the seventeenth century. Such books were generally either printed or sold by an individual dwelling at the White Hart, the Red Lion, the Green Dragon, the Golden Tun, or some such sign. Most of Shakespeare's works, it may be noted, were first issued from houses displaying devices similar to the above, and situated in or near to St Paul's Churchyard. Were an imprint, like that which each of these works bore, to appear on any modern book, it would certainly convey to many the idea that the volume had been printed at an ordinary 'public-house.' In Paris, moreover, to the present day, it is almost or quite as common for ordinary tradesmen to display signs, as it is for hotel-keepers and liquor-sellers to do so. In that city, too, all vendors of firewood and coals have the

fronts of their housee painted so as to convey the idea that they are built of rough logs of wood. This device, though not displayed upon a signboard, is in every way of the nature of a modern tradesman's sign.

In the times when signs were in general use by all tradesmen, it was only natural that each man should endeavour to outdo his neighbours in the obtrusiveness of his signboard. Those firms who advertise on street boardings do precisely the same kind of thing at the present day; each endeavours, by means of brilliancy of colour or novelty of design, to obtain, through his posters, greater publicity for the wares he deals in, and to attract more attention than his neighbours. Just so, a century or more ago, many ingenious devices were made use of to force into notice the signboards of those days. Some of the boards were made of enormous size; others were painted in glaring colours; others bore striking or amusing objects, likely to be remembered by those who saw them; while others were projected far out into the street, or suspended within elaborate, and often really ornamental, frameworks of iron. When each tradesman thus endeavoured to eclipse the signboards of his neighbours, it may well be imagined that inconvenience was caused to the general public. Complaints that the size and prominence of the signboards prevented the access of sunlight and the free circulation of the air in the narrow London streets, first began to be heard, we are told, as early as the beginning of the fifteenth century, when an order was made to abate the nuisance. In the course of time, however, the evil grew again, till Charles II., in 1667, directed that no signboards were thereafter to hang across the streets, but that they were to be fixed against the sides of the houses. Again, however, as years passed by, the nuisance reappeared. In 1762, large powers were once more granted, and there was a general and final clearing away of the too obtrusive signboards. Old prints and engravings of the last century often give a good idea of the way in which the public streets, both of London and other towns, were once disfigured by these overgrown signboards.

This general demolition in 1762 gave a blow to the use of signboards from which those evidences of past ignorance have never since recovered. But had the conditions which first brought them into existence remained the same, there can be no doubt that the signboards would have again risen, phoenix-like, from their own ruins. Happily those conditions have not remained the same. That knowledge of reading and writing which during the present century has become widespread among all classes, has, it may be truly said, given a death-blow alike to the universal use of signs and to the art of the sign-painter. This, to be sure, is not a matter to call for regret on its own account; nevertheless, the great decline in the use of the old-fashioned pictorial signboards is to be regretted for many reasons. The signs our forefathers used have—as already pointed out—largely interwoven them-

selves with our history. In losing them, we are losing one of the well-known landmarks of the past. The signs of the Woolpack and the Golden Fleece, for instance, which are still common in the Eastern Counties, are mementos of the time when the woollen trade flourished in that part of England. The sign of the Coach and Horses, still a very frequent sign everywhere, calls to mind the old coaching-days. Our numerous Arms, our many Lions, Bulls, Dragons, Bears, and Horses—red, blue, black, green, or white—and divers other strangely coloured animals, most of which are quite unknown to men of science, are all relics of mediæval times, when heraldry was cherished and understood by every one. Many similar instances might be pointed out, did space permit.

Most of the signboards now displayed by our inns and taverns bear strong evidence of their own degradation from the high position they once occupied. Inasmuch as they now usually bear the name of the house in written characters, they show most clearly how entirely forgotten are the reasons which originally led to the adoption of the use of signs. Only now and then do we see a pictorial signboard of the real old-fashioned sort.

This decay in the use of inn-signs, however, is no greater than the decline in importance of the inns themselves. These have, within little more than the last half-century, descended from a position of great importance and prosperity to one of comparative degradation. Few persons of the present day have an adequate idea of the extent to which tavern-life influenced thought and manners fifty, one hundred, or two hundred years ago. Then each man had his tavern, much as we now have our clubs and reading-rooms; there he nightly met his friends, heard the high-priced London newspapers read aloud, and discussed the political and business topics of the time. Dickens, in *Barnaby Rudge*, has well sketched the select village company which for many years had met nightly at the old Maypole to tittle and debate. Ale was the universal beverage on these occasions; and in days when there were no colossal breweries at Burton, Romford, or elsewhere, the fame of any tavern was great or small according to the skill of the landlord or his servants in producing this beverage. Inns, too, formed the stopping-places of the many coaches of a hundred years ago, and at them were kept the numerous horses then required for the traffic. In the old coaching-days, indeed, many a small town or village on any main road consisted largely or chiefly of inns; and supplying the necessities for the passing traffic may be said to have formed the 'local industry' by which the inhabitants of such places lived. Thus the inns of olden times combined to a large extent within themselves the various uses to which modern clubs, reading-rooms, institutes, railway stations, eating-houses, hotels, public-houses, livery stables, and the like, are now severally put. Then they were the centres round which most events of the time revolved; now they are little more than tipping-houses for the lower classes.

The various devices used as signs are of infinite variety and varying degrees of interest, from the *Heads*, or portraits, of modern political, naval, or

military celebrities, to such signs as the Rose and Crown, the Fleur-de-Lys, the Spread Eagle, the Cross Keys, our numerous Arms, fantastically coloured animals of all kinds, and many other similar devices. Signs of the former kind require little or no explanation; they are usually modern and uninteresting vulgarisms, and their meanings are self-apparent. With signs of the latter class, however, the case is generally far different, and a search for their original significance, often much obscured by the mists of antiquity, is usually an interesting one. As a rule, such signs will be found to have been derived from the armorial bearings of some sovereign, noble, or other historical personage.

From the quaint and now almost forgotten science of heraldry, indeed, has been derived a large majority of our oldest and most interesting signs. This fact need cause no surprise when it is remembered that in former days every one was familiar with this so-called 'science.' The incomprehensible jargon, spoken of as 'blazon' by heraldic writers, and the various devices appearing on all modern coats of arms, though little more nowadays than grotesque hieroglyphics to most, were once read and perfectly understood even by the common people. A knowledge of heraldry was once, probably, as general as a knowledge of the 'three Rs' is now. It was no wonder, therefore, that the idea early suggested itself to the minds of tradesmen and others to use their own coats of arms—when they had any—or those of the great trade guild to which they belonged, or those of their landlord, or some patron, as signs. This convenient custom, once established, would be sure to be largely followed; there can, indeed, be no question that in this way arose the custom of naming houses the 'So-and-so Arms.' At the present time, the custom itself remains, though its origin has been almost entirely lost sight of. Many inns have in consequence come to be known as the Arms of persons, trades, places, and things which never did, and never could bear, a coat of arms. Such signs, for instance, as the Lilliput Arms, the Cricketers' Arms, and the Libra Arms, are modern and meaningless absurdities. Clearly the origin of the sign of the King's Arms had never occurred to the simple eldritch of whom it is related that he once walked many miles to see King George IV. on one of his journeys, and who came home greatly disappointed; for he found the king had arms like other men, while he had always understood that His Majesty's right arm was a lion, and his left a unicorn. Arms of various kinds form a large proportion of our modern signs, often as much as ten per cent., and sometimes double that in particular districts. As a general rule, where a house has displayed for many years together an armorial sign, the 'coat' will be found to be that of the largest landowner or most prominent personage in the district.

When the general knowledge of heraldry began to decline, and armorial bearings fell largely into disuse, many houses, formerly known as the 'Somebody's Arms,' probably came gradually to be called after, and distinguished by, the most prominent 'charge' in the coat, or after the 'crest' or one of the 'supporters,' which might have been, in heraldic blazon, a lion gules (red),

a bear azure (blue), a white hart, or a rose crowned. Thus undoubtedly originated many strange signs which are still common.

The personal 'badges' adopted by kings and great nobles in early times, and worn on the arm by their servants and retainers, have also given origin to many similar signs. Thus, the White Hart—one of our very commonest sign-board devices—represents the favourite badge of King Richard II., although the white hart has also a legendary existence. The Rose and Crown—another extremely abundant sign—owes its existence to the fact that most of the earlier English sovereigns used a rose crowned as a badge. The Blue Bear, the badge of the once powerful De Veres, Earls of Oxford, is to this day commoner in the county of Essex, where lay the family seat, than anywhere else. The Red Lion, another of our very commonest signs, is probably in the same way derived from the personal badge of John of Gaunt, Duke of Lancaster, though it doubtless represents also the lion in the arms of Scotland. As a rule, fantastically coloured animals will be found to have had an heraldic origin. Creatures in their natural colours either may or may not have been derived from heraldry; thus, the Greyhound, though it has figured both as the badge, and one or both of the 'supporters' of the arms of several English sovereigns, may owe its frequent appearance on the signboard to its modern use in the coursing-field. In the case of the White Horse, too, a very common sign, it is difficult now to decide whether it represents the White Horse of the Saxons, or that of the House of Hanover, or one of the many white horses to be seen in our streets.

The number Three, it will be found, occurs on signboards in most districts more than twice as often as all other numbers put together. This may be partly explained by the fact that three has been regarded as a lucky number from very early times. It is, however, extremely common for three 'charges'—that is, objects—to appear on coats of arms; and there can be no doubt that very many of our modern Threes have had, either directly or indirectly, an heraldic origin. Among signs which have, in all probability, been derived directly from heraldry, may be mentioned the Three Cups, taken from the arms of the Salters' Company; the Three Tuns, from the arms either of the Brewers' or the Vintners' Companies; the Three Compasses, from the armorial bearings of the Carpenters' Company; the Three Pigeons, probably derived from the arms of the Tallow-chandlers' Company; the Three Fleurs-de-Lys—formerly, though not now, a common sign—taken from the arms of France; and many others. To this class also belongs the sign of the Three Golden Balls, still displayed by every pawnbroker. The balls, it is said, represent certain round gilt objects, technically known as 'bezants,' which formed part of the coat of arms of the dukes of Medici, from whose states and from Lombardy most of the early bankers came. These capitalists advanced money on valuable objects, and thus gradually became pawnbrokers. The custom of naming houses the 'Three Somethings' still survives, although the origin of that custom has been lost sight of. Thus, we get such meaningless absurdities as the Three Jolly Wheelers (whatever they may be), the Three Mariners, the

Three Loggerheads, and various others, which may be said to have had an indirectly heraldic origin.

Many signs, too, once formed a 'rehns' or pun on the names of the persons who displayed them; such signs are not now common, though they appear frequently on the 'tokens' issued so numerous by tradesmen in the seventeenth century. Most of these bore the sign under which their issuers traded. Thus, we find Three Comies, or rabbits, on those of Hugh Conny; a Finch on those of John Finch; a Hound and Cock representing Hancock; and a Babe and Tun representing Babington.

Many most absurd and altogether incongruous combinations still appear on our signboards, though these are not so abundant as formerly; thus, we have the Sun and Whalebone, the Dog and Gridiron, the Plough and Sail, the Crown and Blacksmith, the Bull and Horseshoe, and numerous others. In some cases, a connection between the two objects is obvious; every one, for instance, will be able to see what brought together on a signboard the Cat and Fiddle, the Eagle and Child, the Dog and Partridge, George and the Dragon, &c. But in the case of the examples given above, there is no connection between the two objects referred to, and their combination is quite meaningless. They have in most cases arisen from an ancient custom of adding the sign of the old house to that of the new, when a tradesman has been removing from one place of business to another; or else an apprentice, when beginning business on his own account, has added some sign of his own selection to that of the master under whom he formerly served.

Not a few signs for which no likely meaning or derivation can be found are in all probability corruptions; that is to say, they were originally set up to commemorate some person, object, or event of, perhaps, only local celebrity. In the course of time, this became forgotten; and under vulgar pronunciation—or, possibly, on the advent of a new landlord, who knew nothing of the original meaning of the device—the sign was changed to something else which it seemed to imply or nearly resemble. Thus, it is said the sign of the George Canning has become changed into the George and Cannon, and that of the Island Queen into the Iceland Queen. In Oxfordshire there is a house with the sign of the Sheep and Anchor, which probably was once the Ship and Anchor. Another house, in Hertfordshire, formerly had a ship in full sail represented on its signboard; of late years, however, the board has merely been inscribed the Ship; and quite recently, on the advent of a new landlord who had been a cattle-dealer, the sign was changed to that of the Sheep.

Inn-signs have in some cases been painted by artists of considerable eminence. An interesting account of various instances in which this has been the case will be found in the volume of this *Journal* for 1881, page 107.

Want of space obviously prevents any attempt being here made to explain in detail the origin and meanings of all our innumerable existing signs. The last edition of the London Directory enumerates no fewer than seventeen hundred and forty-two distinct devices as appearing in the

metropolis alone. All that it is possible to do here is to indicate in a general way the manner in which most of our modern signs originated, and that has now been done.

BY ORDER OF THE LEAGUE.

CHAPTER XVIII.

'You wished to see me?'

'Yes; if you will be so good as to sit down and listen to me.'

Enid stood looking at her mysterious visitor in some perplexity. There was something almost weird about the strange woman's beauty; but in obedience, she seated herself to listen.

'I have a strange story to tell,' Isodore commenced. 'For a long while now I have been watching over your welfare. Do not think me personal or rude in any questions I may ask. Believe me, I do not for one moment wish to pain you; indeed, on the other hand, I wish to do you a great service.'

Enid inclined her head gently. 'Perhaps it will be as well to have as perfect confidence between us as possible. You already know my name. Will you be so good as to tell me to whom I owe this visit?'

'My name is Isodore.'

Enid looked at her visitor in interest and admiration. This, then, was the beautiful mystery about whom Maxwell had often spoken, the princess to whom the fatal Brotherhood owed allegiance. Then she grew frigid. Had it not been for her and such as her, Frederick would have been with her now.

'You misjudge me,' Isodore continued sadly, for she had read the other's thoughts as easily as an open book. 'Believe me, had I known, Mr Maxwell would never have been sent to Rome. But if I am to continue, I must have your confidence. What if I tell you your lover is in England now?'

'In England, and never came to see me!' Enid exclaimed with a little gasp. 'Impossible! He would surely have written.'

'Nevertheless, it is perfectly true, though he only arrived yesterday. He would have come to you, or written, had I not forbidden him.'

'Forbidden him,' Enid echoed haughtily. 'And why?'

'Because things were not ready,' Isodore replied calmly. 'I did not take a journey to Rome at the hazard of my life, to rescue him from a great danger, to have my plans upset at the last moment. If it had not been for me, Mr Maxwell would not be alive now.' Isodore could not restrain herself sufficiently to conceal this touch of womanly feeling.

Enid's face softened strangely. 'I have heard of you. Forgive me, if I seem cold, but I have been severely tried lately,' she said. 'You do not know what a load you have taken off my mind; and yet, perhaps—' She stopped abruptly; her thoughts turned in the direction of Le Gautier, and wondering how she could face her lover now.

'And yet,' Isodore replied—'and yet you would see a way out of the difficulty into which

the miserable schemes of Le Gautier have placed you? Do I speak plainly, or shall I be more explicit?"

The random shot went home; Enid's face flushed crimson to the fair curls lying on her forehead. 'You speak plainly enough,' she faltered. 'You need say no more. I am dazed and bewildered by your wonderful knowledge.'

'It will be clear enough presently. The clouds are dark now; but I see rays of light here and there. Do you study spiritualism?'

'No,' Enid answered, puzzled by the abruptness and inconsequence of the question. 'I cannot say that I have. But why?'

'If your father is in the house, I shall be glad to see him. Will you be good enough to ascertain if he can be seen?'

'If I tell him, he is wanted on supernatural affairs, he will come.' Enid smiled as she rang the bell. 'It is his craze.'

After a little pause, the baronet entered the room, and, like his daughter, stood enthralled by the visitor's perfect beauty. He bowed low; in spite of his age, he was a lover of the beautiful still. He looked up admiringly in the perfect eyes, and waited for her to speak.

'Sir Geoffrey, you are a swindled, deluded man!'

'Bless me!' the startled baronet exclaimed at this unceremonious opening. 'Swindled, deluded, I? Who by? Impossible!'

'By the conjurer, Le Gautier.'

Sir Geoffrey stared in open-mouthed amazement; even the breeding of the Charterises did not rise to this occasion. Enid's heart gave one leap, and then began to beat violently. She was conscious of some coming revelations of the deepest interest to her, and waited with impatience for Isodore to speak.

'Some time ago, you went to a house near Paddington. You will please correct me if I am in error, Sir Geoffrey. During your presence there you saw several startling manifestations: you were commanded to do certain things, one of which affected deeply your daughter's happiness, and which, by some happy accident, were equally acceptable to Le Gautier. Am I right?'

'Perfectly,' the baronet gasped. 'And I need not say they will be carried out to the letter. I believe.'

'They were a common, vulgar, barefaced swindle!'

'I beg your pardon,' Sir Geoffrey interposed politely, ready to do battle in defence of his pet scheme. 'I cannot agree with you. Le Gautier.'

'Is a low adventurer. I am not talking idly; I can prove every word I say. This very morning, I was at Paddington, and saw the manifestation room, or whatever you may choose to call it. At the back of the room is a large mirror; over the window is another. Preparations for the manufacture of visions to suit any taste were manifest. And one thing in conclusion: the girl who personated your better self and your dead brother, who never was married, is at present under your roof. She is Linda Despard, the girl who met with the accident in Fica-dilly.'

Sir Geoffrey began to feel uncomfortable, and moreover experienced a twinge of common-sense.

There was something so horribly realistic about the beautiful stranger's story, that it shook his faith to its foundation. 'But really, such an extraordinary tale,' he stammered, 'and everything appeared so real. I cannot doubt, the likeness to my brother was so perfect. Am I mad that I should believe this?'

'If you will excuse me for a moment and permit me to see this Linda Despard, I will introduce you to your brother in a few moments.—Miss Charteris, have I your permission?'

'You have my permission to do anything which will clear up the wretched mystery,' Enid cried passionately. 'Even now, I am totally at a loss to know what you are speaking of. Go! Do anything you may desire, so that we can have a little quietness hereafter.'

Without another word, Isodore vanished, leaving Sir Geoffrey pacing the drawing-room in great perturbation and casting uneasy glances in Enid's direction. He was not convinced yet, but his doubts were troublesome. 'It is all nonsense,' he exclaimed. 'I saw with my own eyes.'

'Your brother, Sir Geoffrey.'

The baronet looked up, and there, standing in the doorway, saw Isodore, holding by the hand a figure dressed in a slouch-hat and enveloped in a cloak. For a moment, he staggered back in amazement: it was the lost lighted to the life!

'This is the long-lost brother,' Isodore continued.—'Linda, throw your hat away, and tell Sir Geoffrey the tale you told Lucrece.—Listen, Sir Geoffrey, and you will hear something entertaining, and Miss Charteris something that will restore the bloom to her cheeks.'

Linda Despard pushed her hat aside, and stood, half-boldly, half-timidly, before the startled baronet. There were tears in her eyes as she looked at Enid.

'But what can this possibly have to do with Le Gautier?' Sir Geoffrey demanded.

Isodore waved him aside laughingly. 'Much, if you will have patience,' she said.—'Linda, you had best commence. We are trifling.'

There was an air of command in these words there was no disputing. Enid sank into a chair pale but collected, the baronet standing behind her, looking anything but comfortable. Lucrece took up her place beside her mistress. Isodore stood through the interview.

'Well, I will do anything to help that angel of mercy who has been so good and kind to me!' the actress commenced, with a grateful glance at Enid. 'I tried to do her a great injury; but, thank heaven, I am not too late to save her yet. I am much to blame; but this is a hard world, and there are times when a few shillings are a godsend to me. It is not a long story. Lucrece here, and Isodore, knew my husband, and how he used to treat me, beating, half-starving me, and taking all my earnings to spend at the café. Well, I put up with that life as long as I could; and then, after one awful night, I left him. I came to England, and brought my boy with me. After some hardships, I contrived to get a situation in a London theatre under a new name. It was only a small part, for my imperfect English was against me. One night, some months ago, as I was coming out of the theatre, I met Le Gautier. I had known

him in better days, and though I was not ignorant of his character, it was pleasant to hear the old familiar tongue again. It appeared he had been in the theatre, and recognised me, and waited to say a few words as I came out. Time went on, and he was really kind to me. Through his influence I obtained a rise of salary, and I was grateful. What he really wanted with me you shall hear presently.' The narrator paused a moment here, and looked round in the eager faces. Every sound could be heard distinctly—the ticking of the clocks, and Sir Geoffrey's heavy breathing. 'One night he came to my lodgings,' the speaker resumed, 'and then he asked me if I had forgotten the old spiritualism tricks. I must tell you that once on a time I travelled the continent with a company that played ghostly pieces, such, for instance, as translations of Dickens' *Christmas Carol*, a simple thing, a mere optical illusion, what you call Pepper's Ghost. I told him I thought I could remember, and then he made a proposal to me. I never hesitated; the pay was too good for that. I was to meet Le Gautier at a house near Paddington one night, and go through the old tricks for a gentleman deeply interested in spiritualism. I learnt my lesson well. I was first to personate the better self of the spectator, and afterwards the spirit of his brother.'

'Ah!' Sir Geoffrey exclaimed. 'Go on!'

'I interest you now. I thought I should. I knew at the time, to my shame let me confess it, from the things I had to say, that the spectator was to be got into Le Gautier's power. Well, the night came; the simple apparatus was fixed; everything promised well. I was a bit nervous, for I was out of practice, and I wanted to see what sort of a man the victim was. While they were at dinner, I looked into the room, and there I saw the gentleman whom I now know to be Sir Geoffrey Charteris. When I saw your credulous face,' the narrator continued, addressing the baronet, 'I was no longer afraid. Presently, when it became dark and they sat over their wine, I listened till a word agreed upon was uttered by Le Gautier, and I commenced. First, there was some music, sounding strangely enough in the room, but not to me, for I played it. That was simple to an unbeliever with ordinary nerves; then came flashes of light, also easy enough; and when I deemed I had created a sufficient sense of fear, I entered the room. It was quite dark by that time, and I was dressed from head to foot in close garments. I touched Sir Geoffrey on the face and whispered in his ear; and once when he showed signs of unbelief, I clutched him by the throat and nearly strangled him.—Sir Geoffrey, if I make a mistake in a single particular, correct me.'

'You are perfectly correct,' the baronet answered, flushing scarlet. 'Pray, continue. You do not know what the suspense is to me.'

'Had you been quick and strong of nerve, you would have found it out then, for, as it was, you grasped my arm, covered in wet eel-skins, a creepy thing to touch in the dark, even if you know what it is. That was the first part of the performance, and then the real business commenced in earnest. Le Gautier led you to a room at the back of the house, a room draped in black cloth, and seated you in a certain spot,

daring you to move at your peril. I wonder I did not laugh at this; I did once or twice, I know, so that I had to finish with an hysterical scream, which had the advantage of relieving me and heightening the effect. Well, the jugglery commenced—the meanest trickery, hardly sufficient to deceive a child. It was easy enough to work it under cover of the incense and smoke; for behind your chair, Sir Geoffrey, the curtains were pulled back and a mirror exposed. I stood upon a pedestal in the window, behind another mirror. The illusion is perfect, and all I had to do was to ask and answer questions. I got through the first part of the performance well enough; but when I had to personate Sir Geoffrey's brother, the case was different. Had you, sir, been calm and collected, you must have discovered. I personated the spirit of your brother, desiring penance for some fancied wrong done to my children; and to brighten the effect, two ragged little boys were introduced to personate the dead man's starving and abandoned family. Frightened almost to death by the fear of being haunted, Sir Geoffrey, you promised me anything. You promised to join some League, the meaning of which I do not know, to carry out your dead brother's work; and last, but not least, that my good angel and preserver there should become Le Gautier's wife. The illusion was perfect, and a little of Le Gautier's matchless ventriloquism completed it.—And now,' the speaker continued, running forward and falling at Enid's feet, 'let me implore your forgiveness! My benefactress, how grateful I am that I have been able to serve you!'

'I have nothing to forgive,' Enid replied. 'You have taken far too great a load off my mind for me to reproach you now.'

'But the whole thing is inexplicable to me,' Sir Geoffrey exclaimed. 'How did you manage to impersonate my late brother so accurately?'

Linda Despard smiled and pointed to a photograph album. 'Easy enough with plenty of these about. What simpler than to abstract a likeness from one of these books and give it me! With my theatrical training and knowledge of make-up, the task was nothing.'

'I am all the more astonished,' Isidore remarked, 'that the audacity of the command relating to Miss Enid did not open your eyes.'

'But you understand Le Gautier professed to know nothing of what had taken place,' Sir Geoffrey explained. 'I even had to broach the subject to him. He never by any chance alluded to it!'

'Such cunning as his always proves too deep for simple honesty. I need not ask if you believe what you have heard, Sir Geoffrey!'

'Indeed, I do.—Enid, my child, come and kiss me, and say you forgive your foolish old father. Take me away into the country, where people cannot find me. I am not fit to mix with men of sense; and, O Enid, as soon as it is convenient, tell Varley to go into the library and pick out all the works he can find on spiritualism and burn them.'

'You are sure you have forgiven me?' Linda Despard asked Enid timidly.

'From the bottom of my heart. You have done me a service to-day which I cannot forget, or indeed ever repay.—And to you, Isidore, if

I may call you so, I am grateful. You will pardon me if I seemed harsh or hard when you came here, but I have distrusted every one of late.'

'You have no cause to thank me,' Isodore replied simply. 'I am afraid I must confess that it is not entirely upon your behalf I have done this thing.'

• 'I care not for that. I shall always remember you with gratitude.'

Isodore turned quickly from the window. 'Le Gautier is coming up the steps,' she exclaimed. 'He must not see me here now, or everything will be ruined. I must see you again before I leave the house. Where can I hide? I would not have him discover me now for ten thousand pounds!'

STORIES OF CATS.

So much praise has been lavished on dogs and horses, as exceptionally favoured friends, that scant measure of justice is meted to equally deserving if less popular animals. Notably is this the case towards one animal which Shakespeare, with all his marvellous knowledge of creation, has denominated the 'harmless, necessary cat.' Persons most familiar with the feline race will indeed plead their cause enthusiastically; but such honourable exceptions are few and far between. Those who consider too luxury too costly for the indulgence of a dog, think it no sin to tacitly countenance—if not worse—any amount of harsh treatment or indifference that may under the same roof be accorded to a cat. The origin of so unfair and ignorant a prejudice is somewhat difficult to trace; for, in point of fact, one is no more faultless than the other, although their failings are very differently judged and condoned. At the generality of houses, cats are merely tolerated—as a choice between two evils—lest rats and mice should abound; and supposed to fare sumptuously on such prey, even where, through ill-requited service, none are to be found. When theft or destruction of fragile articles is discovered, blame is usually awarded in one convenient quarter only; whereas the accused thereby is too often made a scapegoat for the shortcomings of others. An animal may be driven by sheer hunger to purloin food, because, through inhumanity, none has been given. A clear case of justifiable larceny! Dumb plain-tiffs, unable to employ counsel, can tell no tales. Could they contradict plausible but false evidence, how many high and hitherto unimpeachable reputations for honesty and veracity would perish!

Cats, in the abstract, might well exclaim with Shylock, 'Suffrance is the badge of 'all our tribe.' They nevertheless have numerous estimable qualities, from which little credit is derived. They are devoted mothers as a rule, guarding their young at the risk of life itself; facing opponents on their behalf from which, by nature, they would fly in abject terror; playing juvenile games, even at an advanced age, to amuse their kittens; keeping them sleek and glossy as satin, while patiently teaching those accomplishments that they will need when left to their unaided resources in after-life. A pattern for the imitation of too many parents. Notwithstanding

such creditable traits of character, kittens are mercilessly destroyed; though some of all other progeny are spared, out of consideration for maternal affection and well-being. A cat is vulgarly said to have 'nine lives'; but, in sober truth, the single existence it can lay claim to is seldom open to envy. Without entering here upon details of many cruelties almost too barbarous for belief, it cannot be ignored that boys, and even men, not otherwise supposed to be utterly devoid of common humanity, think nothing of allowing this most unoffending animal to be deliberately tortured to death by dogs, or similarly revolting practices. They appear to be under a delusion that there is something manly in expressing detestation of cats, while professing fondness for animals in general, and choosing for pets very uninviting specimens. Sundry so-called 'sports'—save the mark!—are now happily illegal; offenders in brutality towards cats are rarely convicted; and—under the present imperfect state of the law for the protection of dumb animals—can then be only very inadequately punished.

Cats are tolerably popular in stables, where they are able to render good return for their lodging at little cost for board. They become greatly attached to horses, their favourite sleeping-place being frequently on a horse's back; a strange selection, which yet appears to be mutually agreeable. It has been widely said that cats are incapable of any great degree of affection, and that the small amount evinced is for their home, and not its inmates. They are, in addition, considered unable to learn tricks and actions which make dogs such amusing companions. It is also thought to be much more difficult to cure the former of faults and natural aversions. Too great reliance may, however, be placed on these assertions. A bad name is easily acquired where champions are few and little intimacy is allowed. 'Leading the life of a cat and dog,' for instance, is popularly supposed to represent the reverse of harmony; yet some cats and dogs—which have not been made enemies—become devoted friends, affording an illustration of peaceful unanimity that many of their biped detractors might profitably imitate. Again, cats, though they have a decided instinct for killing birds, have been taught to abstain from molesting those in cages. Two cases came under the writer's notice where cats were left constantly in places filled with birds, yet never injured any, having been early impressed by the idea that there are birds and birds, some species requiring even protection from harm. The home of one conscientious creature was at a bird-fancier's shop, and no breach of faith resulted from the watchman's being left nightly on guard. The experiment might be hazardous to quote, but other examples could be mentioned. A few well-authenticated anecdotes may clear away some mistaken notions, and tend to the saving of helpless animals from cruelty and neglect.

A military chaplain, when living with his family at Madras, had a favourite cat. Having to change his residence, he removed to another side of the city, a distance of several miles. The in-coming tenant's wife took a great fancy to the cat, and begged that it might be transferred with the house. Through fear that it

would be lost in going so far from familiar haunts, added to the knowledge that a good home would be given, and, more especially, because poor Puss was then in delicate health, she was, after much hesitation, allowed to remain. About three weeks afterwards, the chaplain's wife sitting in the drawing-room of her new home, was amazed to see their old friend enter the veranda, spring into her lap, overwhelming her with caresses, and showing every possible demonstration of delight at their reunion. It was assumed that she had, in an unaccountable manner, come to take up her quarters where an unequivocal welcome was received. Towards evening, the visitor disappeared, as mysteriously as she had arrived, returning the following day, but this time not alone, for in her mouth was a very small kitten, which she gently laid at the feet of her mistress with a pleading and most eloquent expression, as though craving for sanctuary. It need hardly be said that both refugees were incorporated into the household. Upon inquiry, it was ascertained that one kitten only had been spared out of a family horn at the former residence. With this 'sole daughter of her house and heart,' the faithful creature had travelled to those she had 'loved and lost a while.' How such a journey could have been thrice accomplished, through the intricate and wholly unknown streets of so large and populous a city as Madras, bringing on the last occasion so young a kitten safely with her, surmounting all the difficulties and dangers of such a formidable transit, is inexplicable, and must certainly be deemed a marvellous feat. No member of the chaplain's family had visited their old home, not even a servant had passed between the two localities, nor had the new tenants called on the original inhabitants. The extraordinary reflection and foresight shown in first taking the journey alone to insure success, and then fetching the fragile little being prudently left behind, is perhaps the most curious part of this 'owre true tale.' It will be conceded readily that this strong attachment could only have been for those with whom she had so long and happily dwelt. Truth is again stranger than fiction.

A lady living near Eton College—close to that memorable spot, dear to the heart of Eton boys, 'Chalvey Ditch'—possessed, amongst her children's many pets, a beautifully marked tortoiseshell cat, whose 'lot had fallen in a fair ground,' amidst 'the smooth stones of the stream.' When the lady's sons left college, she removed to London—where the cat would not only have led an unhappy life, after roaming about of her own free will, but would probably have been lost—she was, to the sincere regret of her young companions, presented to some friends living at a considerable distance in Windsor Forest, where a luxurious home was offered. A family from elsewhere took the remainder of the lady's lease off her hands, through which arrangement the following story came to light. When writing on business, the question was asked if the lady while living near Eton had amongst her pets a beautifully marked tortoiseshell cat; which being answered in the affirmative, a striking proof of intelligence was narrated. Not long after possession

was taken, such a cat—identified by minute description—arrived during the night, and was found next morning, with a newly born family of kittens, in an outhouse—her chosen lodging on previous interesting occasions—having 'found her way from far in the Forest, whither she had been taken after dark, through or round Eton and Windsor, and thence to her once happy home. It may be a disputed point in this instance whether such fidelity to old associations might be attributed to love for the house or its former owners. Nevertheless, from the warm affection shown by the cat towards the latter, no doubt was felt on the subject by those best able to decide. They were gone beyond her reach, but she had done her utmost, in loving memory of them.

Some boys were observed in a Welsh village carrying a very small snow-white kitten, with 'eyes of most celestial blue,' and being asked its destination, stated that they were about to consign the pretty little creature to an early and a watery grave; from which cruel fate it was promptly rescued by right of purchase. The kitten being too young to quit its hereabout parent, was temporarily returned to her charge, she having in the interim been placed on board-wages. This presumably equitable plan, from some hidden reason, did not answer, and the juvenile pensioner seemed far from thriving. Taffy's peculiar notions as to *meum* and *tuum* may have had something to do with the failure. Prematurely removed to its proprietor's care, the junior member was patiently reared by hand. This Samaritan-like deed brought fairly earned reward, for the foundling grew into a very handsome cat, and became a highly prized favourite. So great was the love of 'Jenny Lind' for those who had saved her from death, subsequently, under domestic difficulties, bringing her to full years of discretion, that although accompanying them in several long journeys, and living in many temporary homes, she never once offered to leave them. Petted and coveted by newer friends, she remained loyal in her allegiance to the end of her days. Another proof of attachment to persons, not places.

A cat belonging to a gentleman resident about eight miles from London, was given to a brewer living at a distant part of the metropolis; taken there after dark in a closed basket placed in a covered wagon. A fortnight had elapsed, when the poor animal, weary and footsore, walked into her former master's kitchen, and lay down in its accustomed corner by the fire, purring with joy at having reached the old home. Such fidelity was deservedly rewarded.

A lady visiting a bird-fancier's shop, was struck by the heauty and size of an Angora cat exhibited for sale, imprisoned in a large parrot's cage. The captive effectually pleading for pity by licking her hand, was purchased and taken home. After some years, the cat was removed with his mistress to Brighton, though under protest as to future reformation. Tom was then probably one of the largest of his species, and universally admired. He had adopted an apparently incurable habit of sharpening his claws on a highly polished dining-room table; and also committed sad havoc amongst the flowers in the garden of his new abode, spending

a great portion of leisure time luxuriously lying in the sunshine, amidst mignonette, &c. A decree of banishment was at length unwillingly issued, and poor innocently erring Tom forthwith departed to a country rectory, where he was much valued. Every kindness that could conduce to his comfort was shown, all his special tastes as to diet consulted; but the exile remained inconsolable. He never attempted to return, not seeming to have sufficient energy left to attempt aught in self-defence; he simply gave himself up to despair. It was vainly hoped that time would reconcile the mourner to his changed lot, but matters only grew worse, the cat pining and fretting till he became the shadow of his former self. He could not twine 'fantastick garlands,' or utter an altogether 'melodious lay,' like 'the fair Ophelia,' but wandered aimlessly about the garden, eating little except green fruit and such strange fare; dying, after a brief period, literally of a broken heart. The chief object of this devoted love was the cook he had left behind him. The attachment, unlike that of Shakespeare's ill-starred heroine, may not have been a romantic one; still, it was purely disinterested, unwavering amidst all more worldly temptations.

Nature is fine in love: and where 'tis fine,
It sends some precious incense of itself
After the thing it loves.

Poor faithful Tom gave the sole offering he had to give—his life. If it be true that 'Man's love is of man's life a thing apart,' it was in the above case proved to be a cat's 'whole existence.'

As an illustration of maternal devotion, the ensuing fact was contributed by a relative. A little girl had set her heart on capturing a wild kitten, which resolutely refused to enter human habitations, neither would it allow any one to go near it, having thus from its birth led a truly Bohemian life. An old gardener told the child, in forcible language, that she might as well try to catch Lucifer himself. Children are not easily daunted in such kindred pursuits, acting confidently on the understanding that everything comes to those who wait. By very slow degrees the waif was first cautiously approached, next timidly caressed, then borne triumphantly home, and finally installed there as a favoured guest. From having been literally in a savage state, it soon became remarkably gentle and domesticated, by the same principle that no rabbit grows so thoroughly tame as the wild species. She was also, during after-years, extremely fond of her young, several of which were reared without disaster; but upon one occasion the cat came to her mistress in a sadly distressed state of mind, eagerly trying to induce her to follow it. Compliance being for the moment put off, the suppliant left in dire grief; presently coming back carrying a dead kitten, which was laid before her friend with bitter lamentations. This being taken away, she brought, one by one, every member of a luckless family, none of which had seen the light. They were then buried, the mother remaining a picture of sorrow. It was hoped the curtain had fallen over the final scene of a domestic tragedy; but the interment could not have been properly carried out, for she dug them up, and again brought each successively

into the house, after which they were more effectively disposed of. A long time elapsed before the poor creature could be consoled for their loss.

WANTED, A CLUE.

IN TWO CHAPTERS.—CHAP. II.

ANOTHER week passed by, Edith growing more and more prostrate each day, and I was very anxious to hear from Dr Archer. At last arrived a letter, in a hand disguised as a lady's, on girlish light-blue note-paper, with 'Helen' stamped on it. These precautions would have made me smile, had I not known how necessary they were. All the letters which entered the house had first to undergo Mrs Morrell's scrutiny.

'I am utterly baffled,' he wrote, in a very shaky hand. 'The experiment from which I hoped so much has turned out an utter failure. All the substances submitted to me have been subjected to the most minute and delicate tests known to science, without discovering in any one of them the slightest trace of arsenic, or any other poison. I am in despair. I know that somehow my darling's life is being undermined by poison, and yet I cannot trace it. I am powerless to interfere. I have nothing but suspicion to go upon, and dare not apply for a magistrate's warrant. My only hope is in you, Miss Armitage!'

I knew I was but a slender reed to trust to; and I went up-stairs to the sickroom, feeling miserable to the last degree. Mrs Morrell was seated by the bedside. Edith looked paler and thinner than ever. She moaned out, when she saw me, that she was 'so thirsty'; and had hardly been supplied with a cooling draught, when the racking cramps from which she had lately suffered so terribly, came on, and she writhed in every limb. I wiped the cold dew from her forehead, afraid at the moment that she was dying, the attack was so terribly severe, and seemed to exhaust her so much. By-and-by, she fell into a doze, and Mrs Morrell went out of the room. Feeling perfectly desperate, I commenced a thorough search through the apartment for anything suspicious, without finding the smallest thing which could serve as a clue. Probably I aroused the invalid, for, in returning to the bedside, I found her staring at me with the fixed gaze of a sick person.

'Edith, dear, tell me, have you ever seen Mrs Morrell—or anybody—put any powder or liquid into your medicine or your food? Have you ever noticed that it had a disagreeable taste, or a sediment at the bottom?'

'No, never,' she answered, with evident surprise. Her breath was clear enough between the paroxysms. 'Never, Alice.'

Just then, a tap sounded at the door, and purblind old Dr Stevens came tottering in, nearly upsetting a small table, and seeming scarcely able to hold his patient's wrist firm in his shaky old fingers. I watched him with the maddening feeling, that if ever two unscrupulous poisoners had the very medical man most desirable in their case, it was these two. Mrs Morrell came into the room, as usual during his visits, and followed him down-stairs.

I waylaid her later on in the day and asked her what Dr Stevens had said. She replied, that unfortunately their darling was very ill, but while there was life there was hope. Then summoning all my nerve, I boldly asked that I might be allowed to sit up with Edith that night. She looked rather astonished, then, thanking me warmly for my 'kind offer,' declined on the plea of not robbing me of my rest. I replied that it was not fair that she should have all the night-nursing; but all I got was a very decided 'No.'

I went away convinced that the danger, whatever it was, was reserved for the night. When the invalid was left alone with her traitorous nurse, in some form the poison was administered.

'Does Mrs Morrell sit beside you all night?' I asked Edith, next time we were alone.

'O no. She would, if I wanted her; but I don't like it. It fidgets me to see her. Besides, I generally sleep pretty well the first part of the night. She puts on her dressing-gown and lies on the bed in the next room, ready to come if I call her.'

The mystery only seemed to grow the more inscrutable, the further I pursued it. I went thoughtfully to my room, in search of a book I was reading aloud to Edith, promising to return immediately. As I stooped to lift the volume from a low shelf, the one ring I wore, which had always been a great deal too large for me, slipped from my finger and rolled away across the floor, to disappear underneath the hangings of my large, old-fashioned bedstead. Much annoyed, and anxious to recover it, for it was priceless to me as my dear mother's engagement ring, I went down on my hands and knees and tried to find it; but in vain. The darkness under the massive draperies was complete, and I could see nothing in the shadow.

I looked round for a light. But there was no gas at the Hall, and my candlestick was carried down-stairs every morning by the housemaid, to reappear no more until late in the evening, on the slah in the hall. I scarcely liked to ring for it, for my position disposed me to trouble the servants as little as possible. All at once, I recollected that the candlesticks were never taken out of Edith's room, and that I could borrow one of hers. I did so, and lighted it, and setting it on the floor, I soon found my ring.

'How badly that candle burns, to be sure!' I remarked to myself as I rose to my feet. 'The wax cannot be good.' The light was anything but pure, being of a peculiar reddish colour; and the flame sputtered so much, that more than once I thought it was going out. At the same time it gave off a fine white smoke.

I stood watching the sputtering flame for some minutes, much puzzled, until I remembered that the invalid was alone all this time. So I carried the candle, still burning, back to her room. To explain my delay, I pointed out what I had noticed, saying that I thought the servants must have substituted some inferior articles of their own for good wax candles, either from carelessness or dishonesty.

'The servants never meddle with my candlesticks,' said Edith languidly. 'They are not sent down to the kitchen; but when they want refilling, Mrs Morrell puts fresh ones in here.

She keeps them in that cupboard; look, and you'll see.'

I opened the cupboard for the first time—for I had never had occasion to go to it before—and there, sure enough, were three or four wooden boxes, which proved to be full of wax candles; thirty pounds-weight at least. Before I closed the door again, Mrs Morrell entered the room. I fancied that her face changed and she turned pale as she saw me standing by the cupboard; but if so, she quickly recovered, and when I made some remark about there being a large stock of candles, composedly answered: 'Yes; she found it best to keep plenty ready at hand, so as not to have to disturb dear Edith by leaving the room to search for lights in the middle of the night.'

I made no further remark, as something warned me it was better to say no more; so I opened my book and began to read.

The next morning, as I was on my way to the invalid's room about eleven o'clock, I became aware of high voices in the hall, and came upon Mrs Morrell and the housemaid Jane engaged in altercation. Jane, who was generally a civil and obliging girl, was flushed with anger, whilst her mistress was paler than usual.

'Very well, then, ma'am, I'll go somewhere else, where I shan't be called to account for every paltry little bit of candle,' said the housemaid as I approached.

'You know perfectly well that it is not the candle I care about, but the disobedience to my express orders, Jane. A month to-day you leave my service.'

'I'll go to-day, ma'am; I don't care if I do lose a month's wages,' returned the girl independently.

'Very well. You need never refer to me for a character,' said Mrs Morrell, biting her lips, as she followed me to Edith's room. She said nothing to me in explanation, beyond merely stating that Jane had been very impertinent.

I found Edith in a terribly prostrate condition, and I could see that Dr Stevens, when he came, had very little hope. I watched Mrs Morrell as she hung over the invalid, and wondered whether I ought not to believe that she was the most tender, loving, and devoted of nurses; for I really almost thought that Dr Archer might be mistaken after all, and that her guardians were as anxious for her recovery as I was. She herself evidently realised her danger, for she asked to have the Bible read to her, and would insist upon pressing a valuable diamond ring upon me as a keepsake. My gentle little friend had so won my heart by her unvarying sweetness, that I could not restrain my tears, and retreated to my own room, where I could give free vent to my feelings.

By-and-by, a knock came at my door, and opening it, I confronted Jane in hat and jacket, ready for departure. 'You've always treated me well, miss, and I thought before I go I'd like to tell you why I'm turned out like a thief, without a character, after being here three years!' began the girl in honest indignation. 'Mrs Morrell's sure to take care you hear her story; so, if you please, you shall have mine first!'

'But I would rather not. You know I am not my own mistress here. Mrs Morrell might not like'—

'Oh, but, please, miss, do listen. It's all on account of the candlesticks in Miss Edith's room. You know, miss, Mrs Morrell never lets us servants touch them—they never go down to the kitchen. But this morning, when I went in at eight to see to the fire, I noticed that one candle had been guttering awfully, and the wax had run down over the sides, and made such a mess as you never saw! Mrs Morrell wasn't there, and Miss Edith was asleep; so I took the candlestick down with me to clean it, meaning no harm. But I had the breakfast to get ready; and to tell you the truth, Miss Armitage, I forgot about it. By-and-by Mrs Morrell came down-stairs, looking regular pale, and wanting to know who took one of the candlesticks away out of Miss Edith's room. I said I had. Then Mrs Morrell went on at me awful, and wanted to know how I dared do such a thing; and I was to bring it back at once. Sarah had washed it; but when we came to look for the piece of candle that was in it, nowhere could we find it. I suspect Sarah threw it into the fire. I told Mrs Morrell it was only a little piece, not so long as my finger. But if you'll believe me, Miss Armitage, she made as much fuss over losing that paltry bit of candle-end as some folks would over a diamond necklace. I really didn't think missis was so mean. I suppose my temper got up, and when she said I was impertinent and should leave, I told her I'd go to-day.'

'I fear you have been foolish and hasty, Jane,' I said reprovingly.

But she went on: 'The queerest thing of all, Miss Armitage, is, that when Mrs Morrell first came into the kitchen she was as white as a sheet. I should have said she was frightened—only it seems ridiculous that any lady could ever be afraid of losing a candle-end! I can't make it out at all, miss. She always is so mortally stingy with those candles of Miss Edith's. Do you know, is there anything about them, miss, that makes them more valuable than other candles?'

'Not that I am aware of.'

'Well, really, do you know, miss, I've sometimes thought there must be something odd about them,' said Jane, turning to go. 'I know, for one thing, they're not bought with the rest from the grocer at Beecham, but come all the way from London; so perhaps that's why Mrs Morrell sets such store by them.—And now, miss, I'll say good-bye.'

I gave the honest girl a little silk handkerchief as a parting gift, and sat down to ruminate on what I had just heard. A drowning man clutches at a straw; and in my terrible distress of mind, I was ready to clutch at any theory, however absurd, for solving the mystery of Edith's illness. Jane's casual remark about there being something queer about the candles so lavishly burned in the sickroom, had set me thinking whether after all there might not be something deleterious in them, intended to act injuriously upon the invalid. It was certain they burned very badly, as if there were some foreign substance incorporated in them. On the other hand, I had never, in my wildest dreams, imagined that there could be such things as poisonous candles. I had never heard of them before. The theory seemed to me at best a very wild one; but Edith's life was at stake, and I was bound to do my

very uttermost to aid her. Mrs Morrell's conduct about the candles seemed odd and suspicious all through. The jealous watch she kept over them; her dread of losing them; her unwillingness to let me be in Edith's room by candle-light—surely all these extraordinary precautions meant something.

Feeling perfectly desperate, I went back to the sickroom. Edith was lying back on her pillows in utter exhaustion, and Mrs Morrell was softly reading a chapter of St John's Gospel. Seeing no other way out of the difficulty, I said boldly: 'Mrs Morrell, if you will go down-stairs into the dining-room, I think Mr Foster wants to speak to you.'

It was an untruth; but I could not afford to be too scrupulous. Mrs Morrell disappeared. I sprang to the cupboard, and took two candles out of a box, and at once went to hide them in my room. When the widow came back, saying she could not find her brother anywhere—I had seen him leave the house some time before—I apologised, and professed to have misunderstood the message. She resumed her reading, whilst I slipped out of the room and hastily put on my outdoor garments. I knew that in going out without leave at such a moment, I risked losing my situation; but I did not care; I was in no mood to stand upon etiquette.

I made my way to the village, to the cottage of a trustworthy man who was sometimes employed to do odd jobs about the Hall. He readily promised to take my small parcel to Dr Archer at once. Had the distance not been three miles, I should have taken it myself.

I heard nothing from Dr Archer during the whole of the next day; and in a perfect torment of doubt and apprehension, I waited and waited, too agitated to eat or sleep, seeing Edith grow worse every hour, and fearing that after all she would die before the mystery of her illness could be solved. She was in a state of prostration fearful to witness. Restless and miserable, I sat in the sickroom or wandered about the house, and had the further trial of seeing that my behaviour had at last aroused suspicion in my employers' minds, and that a quiet surveillance was kept upon my movements. Although I had made no appointment, and scarcely expected to meet Dr Archer, I endeavoured to be in the afternoon in the fir plantation which had already been the scene of several interviews; but Mr Foster so decidedly intimated his intention of accompanying me if I took a walk, that I abandoned the attempt. I detected under the mask of grief so cleverly assumed by both brother and sister, a subdued eagerness and restlessness, attributable no doubt to anxiety as to the success of their scheme.

I felt that all was as good as lost, when, on entering the sickroom on the second morning, I found Edith pallid and almost lifeless, and learned that Mrs Morrell, in real or pretended alarm, had already sent off a messenger for Dr Stevens.

Sick at heart, I sat down by the bedside, and watched the invalid, who was too far gone to recognise me, as she usually did. There came a tap at the door, and 'Please, ma'am, you're wanted,' in the voice of one of the maids; and the widow rose and noiselessly glided out of the

room. My ears were quickened by anxiety, and my curiosity was intense at hearing a short sharp scream, a scuffle, and the sound of an authoritative man's voice on the landing outside. Edith was too languid to notice anything; and even when the door opened again and Dr Archer and an elderly gentleman entered the room, she never opened her eyes.

'My darling! Have the wretches brought you to this?' was the young doctor's quick exclamation; and hurrying to the window, which Mrs Morrell had always religiously kept closed, he opened it, and a stream of chilly but life-giving air came rushing in. The other doctor, who was, I afterwards found, an eminent physician from London, bent over the patient, examining her pulse and administering restoratives. I glanced interrogatively at Dr Archer and murmured one word.

'Those candles? Poisoned. Thoroughly impregnated with arsenic. A very few nights more of breathing the poisoned air, and nothing could have saved her.—I don't know how you came to hit upon the clue so cleverly, Miss Armitage; but I shall bless your sagacity all my life long.'

'And Mrs Morrell and her brother?'

'Are safely in charge of two policemen, and on their way to the county jail. I analysed those candles at once, and then applied for a magistrate's warrant, telegraphing to Dr Weston to meet me here. Two policemen in plain clothes were detailed for the arrest, and the affair was managed very quietly, so that even the servants do not know precisely what has happened. Mr Foster was arrested in his study, and made no resistance, although he assumed a high tone of injured innocence.—Do you know, Miss Armitage, where the rest of the poisoned candles are kept?'

In reply I opened the door of the cupboard and pointed to the rows of boxes. He and Dr Weston then carefully locked and sealed up the door, until the state of the invalid should permit a fuller investigation of the apartment. Dr Archer then informed me that a nurse had been telegraphed for from the Nurses' Home at the county town, and that I need feel no apprehension lest Edith should suffer from the want of skilled attendance.

Nurse Mary soon after arrived, and proved invaluable. All her care and skill, however, were needed to counteract the effects of the poison upon Edith's delicate frame. For days she hung between life and death. Her convalescence was long and tedious; but at length she recovered sufficiently to leave Gorton Hall for the Isle of Wight, where the pure sea-breezes soon brought back the colour to her cheeks.

Investigation proved that the candles similar to those which had been burned nightly in the sickroom for over two months, were highly deleterious. The wax was pure, but the wicks were impregnated by a strong solution of arsenic. The remainder were analysed, and from them much of the poisonous drug was extracted. The closest research, however, failed to discover from whom they had been originally procured. Beyond the fact that the boxes came from London, their origin remains a mystery to this day. The plans of the conspirators had been so cleverly laid that it was almost impossible to bring their wrongdoing home to them.

I wish I could say that both Edith's treacherous guardians received an exemplary punishment; but unfortunately, punishment in this world does not always overtake the criminal. Mr Foster maintained the assertion of his innocence to the last; nor was there one titlle of evidence, direct or indirect, against him. Ably defended by a most skillful advocate, he escaped absolutely scot-free. Mrs Morrell maintained the same line of conduct, and was merely sentenced to imprisonment for two years. Dr Archer and I were aghast and bitterly disappointed at such an obvious failure of justice. But we had one small consolation—that Edith's fortune was secured to her, and that the scheming adventurers who had risked all to grasp her gold were not benefited, after all their trouble, by one farthing.

The Thorndyke family interfered, and her affairs were placed in trustworthy hands until her coming of age. Her twenty-first birthday was also the day of her marriage to Dr Archer; and they are indeed a united pair. I will not write down here all the expressions of gratitude I received from Edith, her lover, and her relatives, for my 'courage' and 'sagacity' in defeating her step-father's murderous designs. I declined Edith's offer of a home with her, for I believed that married people are happiest by themselves; but, though still working for my living, I spend all my holidays with her, and little voices already call me 'Auntie.'

Their home is perfect in all its appointments; but one fact, which is never explained to casual visitors, sometimes strikes new-comers as strange: nothing will induce Dr Archer to have a wax candle in his house. They set it down as a fad and singular fancy; only Edith, he, and I know the truth.

THE LAW OF INNKEEPER AND GUEST.

THESE two terms, appendant one to the other, are now to most people somewhat vague, and seem to point out a state of things a little strange. Of course, we all know what a guest is; but we associate that term more with the friendly interchange of courtesy than with the relation between innkeeper and guest in modern times. The usage is derived from a condition of things that has to a great extent disappeared—when the means of communication between one part of the country and another were less rapid and more limited than now. The roads also were far from good; indeed, about the reign of Queen Elizabeth they were so bad that there were only a few coaches existing; and everything had to be done by means of packhorses and light gigs. To many places, especially in Cumberland, Westmorland, North Lancashire, Wales, and many of the western counties, there were no roads, only a beaten path over a huge lonely common, often a long way above the level of the sea, and extending for many hours' journey. To get to Cumberland out of Westmorland was practically almost impossible, except with the aid of a guide who knew the various passes and the many dangers that lay in the route, including those from the footpad and mounted highwayman. If a traveller visited these lonely places, he would get

rest and refreshment at the village inn; and if he came on horseback, his horse was fed and well taken care of.

In those remote times, therefore, the business of an innkeeper was an important accessory to every country village. His house was usually situated on the high-road, and was called by a variety of names, quaint and funny; and sometimes his sign bore the telling legend, which he did well to follow—that he

Selleth goode ale and beer,
And giveth to all righte goode cheer.

Thus the duty of an innkeeper came to be recognised as one which was most important to the state, one, which it was the bounden duty of judges of the high courts to look well after.

It is long, since the duty of an innkeeper to his guest or traveller was regulated by the common law of the land, while the abuses into which he is liable to fall, have also been made the subject of statute law regulation. The whole law on this subject in England and Scotland is derived from the famous Edict of the Roman prætor, beginning with the words: '*Nautæ cautiones*.' Here is a brief outline of what the innkeeper has to do, and what he has to guard against. Before he is allowed to have a license, his house must be proved to be substantial, and to have sufficient accommodation for man and beast. In fact, anything that a traveller may need or reasonably demand, he should and must supply him with. If the innkeeper refuses without any good or justifiable reason, he is liable to be sued for any damages that the traveller may think due to him for such refusal, and for the annoyance and inconvenience caused thereby. The innkeeper is compelled to let into his house at any time of the night any person who is a *bond fide* traveller; immediately to supply him with refreshments, according to his needs, and to put up his horse and vehicle. When he takes the traveller into his house, the latter immediately becomes his guest, and the innkeeper himself is transformed into 'mine host.' Here begins the proper employment of the innkeeper. He takes care of his guest's luggage, houses his carriage, feeds his horse, and does everything for the care and safety of the accompaniments of his guest. If the latter has servants, he puts them up, sees to their welfare and ease, and indeed becomes one of the most hospitable of men. Of course he knows he will be paid for his trouble—perhaps well paid—and this urges him to make everybody as comfortable as possible. It will be kept in view that a coffee-house, a boarding-house, or a lodging-house, is not an inn.

Let us suppose that some of the property of the guest is stolen; some village rogue has noticed the wealth of the traveller or the abundance of luggage, and has secretly—perhaps during the night—entered the house of the innkeeper and made off with something belonging to the traveller. Or, again, the inn might be set on fire, and except the inmates who would escape, everything within it would be destroyed and consumed. Who, then, is responsible for the traveller's goods? If this had occurred in a friend's house, or anywhere else, of course the owner would be the loser; but it happened in the house of an inn-

keeper, amenable to certain precedents of our common law, and he is liable to the full extent of the loss. But in Scotland, a loss by fire is regarded as *damnum fatale*, and the innkeeper is not liable unless a case of fire-raising by the servant of the inn is proved.

You may say this seems hard, and we answer it does; but still it is an exceptional case. At the same time, it shows what an innkeeper is bound to do, and gives additional security to the goods of a person, seeking the assistance of another unknown to him. The case is different from a person taking upon himself the custody of goods for a premium or charge according to the value of the goods so left with him; for it is not necessary that the innkeeper should even know that his guest had any property with him; and for what might appear to be the absurd carelessness of the owner, he is in many cases responsible.

But perhaps it will be better to give a few of the cases which have occurred on this subject, as proving definitely this peculiar feature of our law. We will first take a case which was tried at the Lancaster assizes in 1793, in which it appeared that a merchant called Bennet was accustomed to send his servant with goods to the market at Manchester. At the time in question, this man had bought certain goods, but had not been able to dispose of them. He consequently endeavoured to find a place where he could leave them until the next market-day. He went to an inn, and there asked the wife of the innkeeper—whose name was Mollor—if he might leave them there; but she replied that she could not tell, for they were full of parcels. The servant then sat down, put behind his chair the parcels of goods he had brought, and had some drink. After sitting a little while, he got up, and found that the parcels were missing. Bennet, the master of the servant and owner of the goods, then sued the innkeeper for their value, and obtained a verdict in his favour.

This case certainly gives the idea that the servant was very careless in allowing his goods to be stolen just behind him; but the matter was well argued out on a rule for a new trial of the cause, which was discharged, the judges holding that the man had immediately upon his entry and asking for something to drink become a guest; and the innkeeper was responsible for the care of the goods brought with him into the house, even though his wife had refused to take care of them until the next market-day, for that was a separate transaction.

But let us cite another case, in which a verdict was given for the innkeeper, it being proved that there were suspicious circumstances, which ought to have been guarded against by the owner of the goods sued for. Some seventy years ago, a Birmingham factor in the course of his business stopped at an inn in Oxford, having with him three boxes of valuable goods, chiefly jewellery. As he desired to show his wares to customers, he asked for a private room, which was provided him. The landlady also gave him the key to the room, so that he might lock the door when he went out. The boxes were removed into this room; and a customer calling, the factor opened his boxes and displayed his goods. Several purchases were made. During this time, the door of the room was twice opened; a stranger looked

in, begged pardon, and immediately withdrew. The door was then hoisted, to prevent further interruption. After they had completed their business, the customer left, and the factor packed up his goods, but did not lock the door. What was stranger still, he said afterwards that he did not know whether he had shut it or left it open. The door also opened into a gateway which led to the street, and on the outside of this door there was found a key. The result of this carelessness was that two of the boxes with their contents were stolen. The factor then endeavoured to recover their value from the innkeeper, but failed. The matter was brought before the superior courts, the judges of which, although they held that the giving of the key to the factor was not sufficient of itself to absolve the innkeeper from his liability, yet they decided he could not be held responsible, after the gross carelessness shown by the plaintiff.

Another case happened at Brighton in 1830, in which a gentleman named Kent sued to recover the value of a reticule and a number of bank-notes which were in it at the time it was stolen. The plaintiff, his wife, and a young lady called Miss Stratford, took a sitting-room and two bedrooms at an hotel in Brighton, so situated that when the door of the sitting-room was open, a person could see the entrances into both bedrooms. Mrs Kent, shortly after they had taken possession, went into one of the bedrooms, laid the reticule on the bed, and afterwards returned into the sitting-room, leaving the door open. After she had been there for about five minutes, she sent Miss Stratford for the reticule; but it was not to be found. Here the jury had no difficulty in finding a verdict for the plaintiff; the only question being, whether money came within the scope of the writ, in the same way as goods undoubtedly did. It being decided in the affirmative, the plaintiff succeeded.

There is no doubt that the liability of the innkeeper is excluded by the contributory negligence of the guest; but the innkeeper must show not only that the guest did not show the ordinary care that might be expected from a prudent man, but also that the loss would not have happened if such care had been shown. But as the guest is entitled to rely on the common-law obligation of the innkeeper, these cases of contributory negligence seldom arise, except where it may be inferred from the acts or words of the parties, that the innkeeper's liability has been qualified or superseded, or where the guest is put on his guard by suspicious circumstances. The usual notice on a bedroom wall about locking the door will not protect the innkeeper, unless the guest actually read it and made no objection. The only other case in which an innkeeper is not liable is that of *damnum fatale*, as where the goods are destroyed by a tempest.

Let us take three other cases, which will show a little diversity, but will further explain our subject. A man came to an inn with a horse, and left it under the innkeeper's care to be fed. This latter put the horse into a field, whence it was stolen; and for this the innkeeper was held to be liable. In the same way, a gentleman, whilst taking refreshments within the house, left his carriage in the care of the hostler, who placed it, as was his custom, in the road; and it was

stolen. The innkeeper was held to be responsible.

The peculiarity of these cases is not only in the fact that the place whence the horse and carriage were severally stolen was not in the inn, but also in the circumstance that they were put in a certain place without the sanction or knowledge of the owner. In a similar case, however, in which the owner had asked that the horse should be put out to pasture beyond the precincts of the inn, the innkeeper was exonerated from all liability in respect of its loss.

We think we have shown by these cases that the responsibility of an innkeeper is by no means a light one, and that it may be taken as a fact, that in ordinary and unexceptional cases, he is liable for the goods of his guest. Here we may add in parenthesis, that he is *not* liable for the person of his guest beyond his own actions; that is, if the guest is assaulted or in any way maltreated on his premises, the innkeeper is not liable beyond what he may himself personally have contributed to such maltreatment. There are, however, many points which may be, and have been, raised, according to the particular circumstances of the case, as where there is attached to the inn an ordinary refreshment bar, and the owner of the goods only makes use of that part of the house; in which case he cannot recover. Again, the innkeeper is only responsible for what happens in his own house—with the exceptions we have before noticed—and by his default, or by that of his servants. He is protected, if the theft is committed by the servants or companions of the traveller. If his house is full, but a person says he will shift for himself among the guests, then he is not responsible for anything that is lost; neither is he, unless the relation of landlord and guest is established.

On this latter point, we will give one more case, which was tried at the last summer assizes at Carlisle. The plaintiff was a traveller for a firm of wine-merchants, and in the course of his journeys he alighted from the train at Carlisle station, to which is connected the *County Hotel*. He at once intrusted his luggage to the hotel porter, with the intention of staying until the next day and sleeping in the hotel. He went up the covered passage into the hotel; but there received a telegram, which he considered necessitated his going to Manchester that day. Before doing so, he asked for some refreshments, and was shown into the refreshment room, which was legally not part of the inn, and not endowed with the same liabilities as the other part, the inn proper. On his way to this room, he met the hotel porter, who asked the number of his room. He said that he did not know whether he was going to stay overnight or not. The porter then locked the luggage in a room in the passage used for that purpose. When the traveller required the luggage, part of it could not be found. For this he sued the innkeeper, but failed, as it was not considered to be satisfactorily proved that he had become a guest of the innkeeper.

By an Act passed in 1863 (26 and 27 Vict. c. 41), the liability of innkeepers for the goods of their guests was limited to the sum of thirty pounds, except in two cases: (1) where the goods were

deposited expressly for safe custody; (2) where the goods were stolen, lost, or injured through the wilful act or neglect of the innkeeper. The innkeeper must put up a notice of the Act in the hall of the inn, and he is entitled to require that deposited goods shall be in a sealed box. This Act does not apply to horses and carriages.

INCIDENTS OF RENT-COLLECTION IN IRELAND.

THE collection of rents in Ireland is often an unpleasant duty; but amusing incidents sometimes arise. Last year, a farmer in the county of Cavan came to me on the rent-day and said he could not pay more than half the sum he owed. He had much to tell of losses, bad times, and low prices; and I listened with patience until he had finished. I then reminded him that his rent had been reduced under the Land Act, and that I had voluntarily cancelled a considerable arrear; and I firmly refused to accept less than the full amount. Mickey Sheridan—that was his name—was married, and I knew his wife ruled the roast.

'Now, Mickey,' said I, 'you ought to be ashamed of yourself! After what has been done to relieve you, I did expect you to behave better. I am sure your wife would not approve of your conduct.'

Mickey had frequently confided to me that 'herself'—his wife—gave him 'a sore life;' and I desired to learn how far she had meddled in this matter.

After some hesitation, he replied: 'Well, sir, if ye won't discover on me, I'll tell ye the thruth. Iself advised me to pay only half the rent. She's a good scholar, an' reads the papers; an' she tells me a new Land Act will soon be passed an' all arrears wiped out—Will yer honour take the half-year?'

'No, Mickey, I cannot. Be honest, and pay the money you owe. I feel sure you have it all in your pocket.'

That was a hit; for Mickey, with an Irish peasant's quick sense of the humour of the situation, replied: 'Begorra, it's in two pockets! Iself made up the two half-years in separate parcels, an' put them into different pockets, to purvint any mistake; an' I was only to give yer honour one of them, if I could manage it. But here's the full money, an' maybe it's best to keep out of debt.'

A few weeks later, when I was collecting rents in the county of Longford, one of the principal tenants came forward, before any money had been paid, as the spokesman of thirty others who were present, and asked for an abatement.

'Why, Pat Molloy,' said I, 'you and all here hold your farms at reduced rents, which you agreed to pay under an amicable arrangement made only two years ago and according to the provisions of the Land Act. I cannot do what you ask; but if you really have not the full year's rent, I will accept three-fourths of it and give you a reasonable time to pay the remainder.'

'We thank yer honour,' said Pat; 'an' here is my money.'

'How much did you give me?' said I, after I had carefully twice counted the bundle of notes.

'Thirty pounds, sir; an' all in one-pound notes; an' shure, it's the hard work I had to make it!'

'Och, thrue for ye, Pat Molloy!' said a voice behind him; 'faith, it's not aisy to make the rint those times!'

'Well, Pat,' said I, 'you have given me thirty-nine pounds; and I now have the pleasure of handing you the receipt for the same.'

Whether the ten-pound note had been paid to Pat Molloy in mistake for one pound, and its value was unknown to him, or that he had omitted to take it out of the bundle, could only be matter of conjecture. He kept a close month, and left the room.

The misadventure of their leader broke up the concerted union of the tenants; and when I announced, after Molloy departed, that I should insist on full payments—seeing ten-pound notes were apparently plentiful in the district—nearly all the tenants came forward and paid.

It is well known that a great part of the thirty million of deposits held by the Irish joint-stock banks have been lodged by farmers. I have often received deposit receipts when collecting rents. I remember a thrifty man who used to lodge his savings when they reached even five pounds. On the rent-day, it was his annual custom to enlarge on the badness of the times and the low prices; but he invariably supplied the best refutation of his statements by producing a number of deposit receipts for small sums and indorsing them with much pride.

When the land agitation was at its height a few years ago, a friend of mine was collecting rents one day in a town in the county of Leitrim. He was seated in a large room of a hotel, and nearly fifty tenants were present. Very little money had been paid. Abatements were asked which the agent had no power to make, and there was more conversation than business going on. But my friend understands the Irish character and its love of talk, and he knew that if he permitted the men to expatiate on the reasons why they could not pay, he would be more likely finally to get the money; so, he patiently listened to the usual jeremiades, and bided his time. But fortune favoured him. The ringleader, or chief Land-Leaguer, amongst the assembled tenants was Denis Lynch. He held a small farm, but was also a cattle-dealer, and his time was of value to him; and finding he could extract no further concession from the agent, who had offered a fair abatement, he announced that he would pay a half-year's rent.

'I must be off,' he said, 'to the fair of Boyle, sir, an' can't deily here, like those men. Here is a deposit receipt for ten pounds, an' the half-year's rint is nine pounds. But be all the saints, yer honour, I made the little thrillo by dealing, an' not out of the farm!'

'Well, Denis,' said the agent, 'you could not deal in cattle without a farm to feed and rest your stock; and I have told you that I am instructed not to accept less than a year's rent. But'—glancing at the deposit receipt, which he had taken from the man, and turning it down on the table—'indorse this receipt, and I will consider your case.'

Lynch wrote his name across the back of the

document; and the other adding his own signature, said to his clerk: 'Take this receipt to the bank up the street and fetch me pound-notes for it.' He then proceeded to fill a form of receipt for a year's rent, and handed it to Lynch, who was astute enough to see that he might profit by what he supposed was an error, and quietly folded up the receipt and put it into his pocket.

When the clerk returned, the agent said: 'Now, Denis, here is your change;' and he began counting and pushing across the table, to the astonished tenant, note after note.

'O sir,' cried Lynch, 'what are ye doin' at all?'

'Why, Denis,' replied the other, 'I am paying what is due to you. You gave me a deposit receipt for one hundred pounds; you have got a receipt for a year's rent; and here are eighty-two one-pound notes, together with eighteen shillings in silver, which is five per cent. discount on your rent. You can't blame me for retaining a year's rent—you accepted a receipt for it. And indeed, when a man has hundreds at his banker's, he may fairly be required to pay his rent in full. Yet, I make you an allowance. You cannot suppose, after what has taken place, and your readiness to avail yourself of what you believed to be an error in the rent receipt, that you should receive the ten per cent. abatement offered to the tenants generally. I have given you half of it, not wishing to be severe. But your tricks have not succeeded; and I hope you won't forget the lesson of to-day, and that you will remember in future that honesty is the best policy.'

All eyes in the room were turned on Lynch, who hastily gathered up the notes and stuffed them into his pockets; and as he made his way to the door, he was heard to murmur, 'Begorra, 'twas the wrong receipt!'

He departed, feeling he had lost all title to leadership; and as men will still worship success, even when accidental, many voices joined in complimenting 'his honour, who was too sharp for Denis Lynch, who thought to act the rogue, but met wia a mistake, glory be to God!'

'His honour' was soon busily employed in receiving the full rents, which nearly all the tenants had brought with them. But he believes his collection on that day would have been a very small one, if Denis Lynch had not presented the 'wrong' deposit receipt.

'CLERGYMAN'S SORE THROAT.'

Dr Thomas Whipham, M.B., F.R.C.P., physician to St George's Hospital, and in charge of the department for Diseases of the Throat there, claims to have discovered the origin of 'clergyman's sore throat,' a disorder which often proves so troublesome to ministers of religion. He was struck, it appears, by the circumstance that barristers—from whom as great oratorical efforts are exacted as from clergymen—do not suffer from this highly painful and inconvenient form of sore throat. He looked around for an explanation, and endeavoured, at first, to trace it to adverse atmospheric conditions. But he early decided that the air of a crowded court of law must be more injurious than that

of an ordinary place of worship; and hence he was forced to seek elsewhere a satisfactory solution of the problem he had set himself. At length the different positions, in relation to their auditors, from which clergymen and barristers spoke, suggested itself for consideration. While a barrister slightly threw back his head in addressing the judge and jury who were seated above him, the clergyman depressed his in addressing the congregation seated below him. Experiments were made with a man reading aloud with his head in the two positions. In the first, the tone of his voice was clear and penetrating, and phonation was practised with a minimum of exertion; in the second, the tone grew muffled, and the previous distinctness could only be approximated with additional effort. Now was indistinct utterance the only result recorded of the experiment in the second position. The friction of the air passing through the throat of the reader was very much increased. Thus, says Dr Whipham, hyperemia was established in the parts affected by this excessive friction; and temporary hyperemia, if frequently encouraged, soon becomes chronic congestion. Dr Whipham was satisfied that he had arrived at the true cause of 'clergyman's sore throat;' and facts soon came to confirm his impression. Two clergymen, hailing from different parts of the country, placed themselves under treatment for the disorder, which had long held a hold on them. They were directed, in speaking from the pulpit, for the future to hold their heads well up, instead of allowing them to droop forwards and downwards. Both soon reported 'a speedy relief from their suffering.'

IN THE DISTANT YEARS.

We met last in the distant years,
And parted, ne'er to meet again;
My aching eyes were filled with tears,
My heart was sore with untold pain.
But, though we parted thus for aye,
A lingering hope my heart yet holds,
That we may meet again some day
Ere Death shall shroud us in his folds.

We parted; 'twas the old, old way;
A too well-trusted friend's deceit
Had taken each from each away,
Both hoping nevermore to meet.
He thought that I was false; while I,
Enshadowed under falsehood's spell,
In anger said a last good-bye
To him I once had loved so well.

But now I know the truth at last;
I would I knew he knew the same,
To come to me from out the past
And tell me I was not to blame.
But, ah! 'tis maybe all too late:
That day of joy may never dawn;
I can no more than watch and wait,
And through the future years hope on.
J. A. M'DONALD.

PRICE 1½d.

JUST BEFORE WINTER.

BY RICHARD JEFFERIES,

AUTHOR OF THE 'GAMKERRER AT HOME,' ETC.

A RICH tint of russet deepened on the Forest top and seemed to sink day by day deeper into the foliage like a stain; riper and riper it grew, as an apple colours. Broad acres these of the last crop, the crop of leaves; a thousand, thousand quarters, the broad earth will be their barn. A warm red lies on the hillside above the woods, as if the red dawn stayed there through the day; it is the heath and heather seeds; and higher still, a pale yellow fills the larches. The whole of the great hill glows with colour under the short hours of the October sun; and overhead, where the pine-cone hang, the sky is of the deepest azure. The conflagration of the woods burning luminously crowds into those short hours a brilliance the slow summer does not know.

The frosts and mists and battering rains that follow in quick succession about the equinox, the chill winds that creep about the fields, have ceased a little while, and there is a pleasant sound in the fir-trees. Everything is not gone yet. In the lanes that lead down to the 'shaws' in the dells, the 'gills,' as these wooded depths are called, buckler ferns, green, fresh, and elegantly fashioned, remain under the shelter of the hazel-lined banks. From the tops of the ash-wands, where the linnets so lately sang, coming up from the stubble, the darkened leaves have been blown, and their much-divided branches stand bare like outstretched fingers. Black-spotted sycamore leaves are down, but the moss grows thick and deeply green; and the trumpets of the lichen seem to be larger now they are moist, than when they were dry under the summer heat. Here is herb-Robert in flower—its leaves are scarlet; a leaf of St John's wort, too, has become scarlet; the bramble leaves are many shades of crimson; one plant of tormentil has turned yellow. Furze bushes, grown taller since the spring, bear a second bloom, but

not perhaps so golden as the first. It is the true furze, and not the lesser gorse; it is covered with half-opened buds; and it is clear, if the short hours of sun would but lengthen, the whole gorse hedge would become aglow again. Our trees, too, that roll up their buds so tightly, like a dragon's cloak, would open them again at Christmas; and the sticky horse-chestnut would send forth its long ears of leaves for New-year's Day. They would all come out in leaf again if we had but a little more sun; they are quite ready for a second summer.

Brown lie the acorns, yellow where they were fixed in their cups; two of these cups seem almost as large as the great acorns from abroad. A red dead nettle, a mauve thistle, white and pink bramble-flowers, a white strawberry, a little yellow tormentil, a broad yellow dandelion, narrow hawkweeds, and blue scabious, are all in flower in the lane. Others are scattered on the mounds and in the meads adjoining, where may be collected some heath still in bloom, prunella, hypericum, white yarrow, some heads of red clover, some beautiful buttercups, three bits of blue veronica, wild chamomile, tall yellow weed, pink centaury, succory dock cress, daisies, fleabane, knapweed, and delicate blue harbells. Two York roses flower on the hedge: altogether, twenty-six flowers, a large bouquet for the 19th of October, gathered, too, in a hilly country.

Besides these, note the broad hedge-parsley leaves, tunnelled by leaf-miners; bright masses of baws gleaming in the sun; scarlet hips; great brown cones fallen from the spruce-firs; black heart-shaped bindweed leaves here, and buff bryony leaves yonder; green and scarlet berries of white bryony hanging thickly on vines from which the leaves have withered; and bunches of grass, half yellow and half green, along the mound. Now that the leaves have been brushed from the beech saplings, you may see how the leading stem rises in a curious wavy line; some of the leaves lie at the foot, washed in white dew, that stays in the shade all day; the wetness of the dew makes the brownish red

of the leaf show clear and bright. One leaf falls in the stillness of the air slowly, as if let down by a cord of gossamer gently, and not as a stone falls—fate delayed to the last. A moth adheres to a bough, his wings half open, like a short brown cloak slung over his shoulders. Pointed leaves, some drooping, some horizontal, some fluttering slightly, still stay on the tall willow-wands, like bannerets on the knights' lances, much torn in the late battle of the winds. There is a shower from a clear sky under the trees in the forest; brown acorns rattling as they fall, and rich coloured Spanish chestnuts thumping the sward, and sometimes striking you as you pass under; they lie on the ground in pocketfuls. Specks of brilliant scarlet dot the grass like some bright berries blown from the bushes; but on stooping to pick them, they are found to be the heads of a fungus. Near by lies a black magpie's feather, spotted with round dots of white.

At the edge of the trees stands an old timbered farmstead, whose gables and dark lines of wood have not been painted in the memory of man, dull and weather-beaten, but very homely; and by it rises the delicate cone of a new oast-house, the tiles on which are of the brightest red. Lines of bluish smoke ascend from among the bracken of the wild open ground, where a tribe of gypsies have pitched their camp. Three of the vans are time-stained and travel-worn, with dull red roofs; the fourth is brightly picked out with fresh yellow paint, and stands a marked object at the side. Orange-red beeches rise beyond them on the slope; two hoop-tents, or kibikas, just large enough to creep into, are near the fires, where the women are cooking the gypsy's *bouillon*, that savoury stew of all things good: vegetables, meat, and scraps, and savouries, collected as it were in the stockpot from twenty miles round. Hodge, the stay-at-home, sturdy carter, eats bread and cheese and poor bacon sometimes; he looks with true British scorn on all scraps and soups, and stockpots and *bouillons*—not for him, not he; he would rather munch dry bread and cheese for every meal all the year round, though he could get bits as easy as the other and without haggling. The gypsy is a cook. The man with a gold ring in his ear; the woman with a silver ring on her finger, coarse black snaky hair like a horse's mane; the boy with naked olive feet; dark eyes all of them, and an Oriental, sidelong look, and a strange inflection of tone that turns our common English words into a foreign language—there they camp in the fern, in the sun, their Eastern donkeys of Syria scattered round them, their children rolling about like foals in the grass, a bit out of the distant Orient under our Western oaks.

It is the nature of the oak to be still, it is the nature of the hawk to roam with the wind. The Anglo-Saxon labourer remains in his cottage generation after generation, ploughing the same fields; the express train may rush by, but he feels no wish to rush with it; he scarcely turns to look at it; all the note he takes is that it marks the time to 'knock off' and ride the horses home. And if hard want at last forces

him away, and he emigrates, he would as soon jog to the port in a wagon, a week on the road, as go by steam; as soon voyage in a sailing-ship as by the swift Cunarder. The swart gypsy, like the hawk, for ever travels on, but, like the hawk, that seems to have no road, and yet returns to the same trees, so he, winding in circles of which we civilised people do not understand the map, comes, in his own times and seasons, home to the same waste spot, and cooks his savoury *bouillon* by the same beech. They have camped here for so many years, that it is impossible to trace when they did not; it is wild still, like themselves. Nor has their nature changed any more than the nature of the trees.

The gypsy loves the crescent moon, the evening star, the clatter of the fern-owl, the 'beetle's hum. He was born on the earth in the tent, and he has lived like a species of human wild animal ever since. Of his own free-will he will have nothing to do with rites or liturgies; he may perhaps be married in a place of worship, to make it legal, that is all. At the end, were it not for the law, he would for choice be buried beneath the 'fire-place' of their children's children. He will not dance to the pipe ecclesiastic, sound it who may—churchman, dissenter, priest, or laic. Like the trees, he is simply indifferent. All the great wave of teaching and text and tracts and missions and the prodence of the printing-press has made no impression upon his race any more than upon the red-deer that roam in the forest behind his camp. The negroes have their fetish, every nation its idols; the gypsy alone has none—not even a superstitious observance; they have no idolatry of the Past, neither have they the exalted thought of the Present. It is very strange that it should be so at this the height of our civilisation, and you might go many thousand miles and search from Africa to Australia before you would find another people without a Deity. That can only be seen under an English sky, under English oaks and beeches.

Are they the oldest race on earth? and have they worn out all the gods? Have they worn out all the hopes and fears of the human heart in tens of thousands of years, and do they merely live, acquiescent to fate? For some have thought to trace in the older races an apathy as with the Chinese, a religion of moral maxims and some few joss-house superstitions, which they themselves full well know to be naught, worshipping their ancestors, but with no vital living force, like that which drove Mohammed's bands to zealous fury, like that which sent our own Puritans over the sea in the *Magnificent*. No living faith. So old, so very, very old, older than the Chinese, older than the Copts of Egypt, older than the Aztecs; back to those dim Sanskrit times that seem like the clouds on the far horizon of human experience, where space and chaos begin to take shape, though but of vapour. So old, they went through civilisation ten thousand years since; they have worn it all out, even hope in the future; they merely live acquiescent to fate, like the red-deer. The crescent moon, the evening star, the clatter of the fern-owl, the red embers of the wood-fire, the pungent smoke blown round about by the occasional puffs of wind, the shadowy trees, the sound of the horses cropping the grass, the night that steals on till the stubbles

alone are light among the fields—the gypsy sleeps in his tent on mother-earth; it is, you see, primeval man with primeval nature. One thing he gains at least—an iron health, an untiring foot, women whose haunches bear any burden, children whose naked feet are not afraid of the dew.

By sharp contrast, the Anglo-Saxon labourer who lives in the cottage close by and works at the old timbered farmstead, is profoundly religious.

The gypsies return from their rambling soon after the end of hop-picking, and hold a kind of informal fair on the village green with cock-shies, swings, and all the clumsy games that extract money from clumsy hands. It is almost the only time of the year when the labouring people have any cash; their weekly wages are mortgage^d beforehand; the hop-picking money comes in a lump, and they have something to spend. Hundreds of pounds are paid to meet the tally or account kept by the pickers, the old word tally still surviving, and this has to be charmed out of their pockets. Besides the gypsies' fair, the little shopkeepers in the villages send out circulars to the most outlying cottage announcing the annual sale at an immense sacrifice; anything to get the hop-pickers' cash; and the packmen come round, too, with jewelry and lace and finery. The village by the Forest has been haunted by the gypsies for a century; its population in the last thirty years has much increased, and it is very curious to observe how the gypsy element has impregnated the place. Not only are the names gypsy; the faces are gypsy; the black coarse hair, high cheek-bones, and peculiar forehead, linger; even many of the shopkeepers have a distinct trace, and others that do not show it so much, are known to be nevertheless related.

Until land became so valuable—it is now again declining—these Forest grounds of heath and bracken were free to all comers, and great numbers of squatters built huts and inclosed pieces of land. They cleared away the gorse and heath and grubbed the fir-tree stumps, and found, after a while, that the apparently barren sand could grow a good sward. No one would think anything could flourish on such an arid sand, exposed at a great height on the open hill to the cutting winds. Contrary, however, to appearances, fair crops, and sometimes two crops of hay are yielded, and there is always a good bite for cattle. These squatters consequently came to keep cows, sometimes one and sometimes two—anticipating the three acres and a cow—and it is very odd to hear the women at the hop-picking telling each other they are going to churn to-night. They have, in fact, little dairies. Such are the better class of squatters. But others there are who have shown no industry, half gypsies, who do anything but work—tramp, beg, or poach; sturdy fellows, stalking round with toy-brooms for sale, with all the blackguardism of both races. They keep just within the law; they do not steal or commit burglary; but decency, order, and society they set utterly at defiance. For instance, a gentleman pleased with the splendid view, built a large mansion in one spot, never noticing that the entrance was opposite a row of cottages, or rather thinking no evil of it. The result was that neither his wife nor visitors could go in or out

without being grossly insulted, without rhyme or reason, merely for the sake of blackguardism. Now, the pure gypsy in his tent or the Anglo-Saxon labourer would not do this; it was the half-breed. The original owner was driven from his premises; and they are said to have changed hands several times since from the same cause. All over the parish this half-breed element shows its presence by the extraordinary and unusual coarseness of manner. The true English rustic is always civil, however rough, and will not offend you with anything unspeakable, so that at first it is quite bewildering to meet with such behaviour in the midst of green lanes. This is the explanation—the gypsy taint. Instead of the growing population obliterating the gypsies, the gypsy has saturated the English folk.

When people saw the red man driven from the prairies and backwoods of America, and whole States as large as Germany without a single Indian left, much was written on the extermination of the aborigines by the stronger Saxon. As the generations lengthen, the facts appear to wear another aspect. From the intermarriage of the lower orders with the Indian squaws, the Indian blood has got into the Saxon veins, and now the cry is that the red man is exterminating the Saxon, so greatly has he leavened the population. The typical Yankee face, as drawn in *Punch*, is indeed the red Indian profile with a white skin and a chimney-pot hat. Upon a small scale, the same thing has happened in this village by the Forest; the gypsy half-breed has stained the native blood. Perhaps races like the Jew and gypsy, so often quoted as instances of the permanency of type, really owe that apparent fixidity to their power of mingling with other nations. They are kept alive as races by mixing; otherwise, one of two things would happen—the Jew and the gypsy must have died out, or else have supplanted all the races of the globe. Had the Jews been so fixed a type, by this time their offspring would have been more numerous than the Chinese. The reverse, however, is the case; and therefore, we may suppose they must have become extinct, had it not been for fresh supplies of Saxon, Teuton, Spanish, and Italian blood. It is in fact the intermarriages that have kept the falsely so-called pure races of these human parasites alive. The mixing is continually going on. The gypsies who still stay in their tents, however, look askance upon those who desert them for the roof. Two gypsy women, thoroughbred, came into a village shop and bought a variety of groceries, ending with a pound of biscuits and a Guy Fawkes' mask for a boy. They were clad in dirty jackets and hats, druggle-tails, unkempt and unwashed, with orange and red kerchiefs round their necks (the gypsy colours). Happening to look out of window, they saw a young servant-girl with a perambulator on the opposite side of the 'street'; she was tidy and decently dressed, looking after her mistress' children in civilised fashion; but they recognised her as a deserter from the tribe, and blazed with contempt. 'Don't she look a figure!' exclaimed these dirty creatures.

The short hours shorten, and the leaf-crop is gathered to the great barn of the earth; the oaks alone, more tenacious, retain their leaves,

that have now become a colour like new leather. It is too brown for buff—it is more like fresh harness. The berries are red on the holly bushes and holly trees that grow, whole copes of them, on the forest slopes—the Great Rough—the half-wild sheep have polished the stems of these holly trees till they shine, by rubbing their fleeces against them. The farmers have been drying their damp wheat in the oasthouses over charcoal fires, and wages are lowered, and men discharged. Vast loads of brambles and thorns, dead fire, useless hop-poles and hopbines and gorse are drawn together for the great bonfire on the green. The 5th of November bonfires are still vital institutions, and from the top of the hill you may see them burning in all directions, as if an enemy had set fire to the hamlets.

BY ORDER OF THE LEAGUE.

CHAPTER XIX.

NEAR one window stood a high Japanese screen, with plate-glass panels. Isodore had barely time to conceal herself behind this, when Le Gautier entered. He seemed somewhat hurried, but otherwise calm enough, as he walked into the room and towards Enid. 'Before I leave'—Then he stopped suddenly.

Sir Geoffrey was standing a little way back from the group, one hand behind his back, the other pointing with unsteady forefinger to Linda Despard, while he never moved his eyes from Le Gautier's face. A little flick of the nostrils, a quiver of the lip, and the Frenchman was himself again. But Sir Geoffrey never moved; he merely opened his lips, and snapped out one word, 'Well?'

'Is this a theatrical rehearsal?' Le Gautier asked at length.

'I am waiting,' the baronet returned, 'for some explanation. To a man of your astuteness, I need not be explicit. This lady, monsieur, and you, I hear, are old acquaintances.'

'You talk in riddles, Sir Geoffrey.'

'You are anxious to gain time. I, on the other hand, do not wish to be too hard upon you. Let me explain. Miss Linda Despard—who has been in my house for some time, the result of an accident, the details of which you have probably heard—turns out to be an old friend of yours. She is dressed this, moment, you perceive, in a character which had been rehearsed under your personal superintendence—the character of my late brother.'

'But what can this possibly have to do with me?'

'A truce to this folly!' Sir Geoffrey cried warmly. 'I have heard everything about the jugglery at Paddington—the mirrors, and Pepper's Ghosts, and the whole miserable machinery by which I was deluded.'

'Then you no longer believe?' Le Gautier asked, fixing his glittering eyes upon the baronet's face.

But the magnetic power was gone now; the

glance was returned as sternly. Sir Geoffrey seemed a new man. 'I do not believe,' he replied.

'Then take the consequences—be a haunted, miserable man for the rest of your days! You will not be warned. I have done all I can for you. If you like to believe the tale you have heard, I will not prevent you. I say again, take the consequences.'

'On the contrary, my good sir, it is you who will be the principal sufferer. I wish to make this interview as pleasant as possible, and cannot do better than by making it brief. There was a little contract between us, which you will consider at an end from this moment.'

'And why?' Le Gautier asked hotly. 'You have proved nothing against me at present. This Linda Despard, whose tale you have been listening to, is no friend of mine.'

'Can you look her in the face and say that she is wrong?' Sir Geoffrey interrupted. 'Of course, you cannot deny the truth of her words. Then why am I bound to fulfil my contract with you?'

'Because I have your word it shall be so. On your word, and by the power I hold over you, I claim my wife still.'

'And in good time, you shall have her, Hector le Gautier.'

The group assembled there looked suddenly at Lucrece, as she spoke. She came forward now, facing the Frenchman, who eyed her with an undisguised sneer.

'And what has the maid of Miss Charteris to do with me?'

'Much,' she answered quietly.—'Do you know who I am?'

'A servant who has got into the drawing-room by mistake. If I am wrong, please enlighten me.'

Lucrece stepped forward, throwing her head back, and placing one hand upon a table at her side. 'I will enlighten you. Five years is a long time in a lifetime like mine, but your memory will carry you back to the Villa Mattio. Hector le Gautier, I am Lucrece Visci, sister of your friend Carlo Visci.'

'And I am no wiser now.'

'But I am,' Enid exclaimed.—'Father, you remember Signor Visci, the artist who used to meet us at Rome?'

'Yes, my dear'—with a glance at Le Gautier—'a fine specimen of an Italian gentleman. The only unpleasant recollection I have of him is, that he first introduced me to Monsieur le Gautier.'

The Frenchman's eyes flashed, and he moved as if to speak; but Lucrece continued rapidly: 'You may not remember me; but you have not forgotten my sister, Genevieve.—Ah! I have moved you now!—Miss Charteris, you were in Rome when she disappeared. Her false lover stands before you now!'

'It is false!' Le Gautier exclaimed. 'Prove that I!'

'It is true.—Prove it? Look at your own face there!' Lucrece cried, pointing to a mirror opposite him. 'Look there, and deny it if you can!'

'True or false, I cannot waste words with you.—Sir Geoffrey, I hold you to your promise.—Enid, you shall keep your word.'

'We are not in the habit of bestowing the daughters of our house upon adventurers,' Sir Geoffrey replied. 'I am sure your natural good sense and a little calm reflection will show you the folly of your demand.'

'My father has spoken for me,' Enid said. 'I have nothing to add.'

Le Gautier stepped across the room to her. She rose to her feet in alarm. Lucrece stood between the two, and grasping Enid by the wrist, and laying her hand upon the Frenchman's shoulder, held him back. 'Are you mad that you ask this thing?' she asked.

'And where?'—'How does it concern you?'

She looked him steadily in the face as she replied: 'Then I must refresh your memory; and raising her voice, till it rang through the lofty room, 'because you have a wife already!'

Le Gautier staggered back; but he was not beaten yet. 'Another of your little fabrications,' he said mockingly.

'Look at him!' Lucrece exclaimed, turning to the others, and pointing at the detected man with infinite scorn. 'Look into his face—mark his dejected air, though he braves it out well, and tell me if I am wrong.'

'Your word is doubtless a good one; but there is something better than words, and that is proof. Do you not think I can see through this paltry conspiracy which has been got up against me? But you have the wrong man to deal with in me for that. I will have the compact fulfilled; my power is not over yet; and, Sir Geoffrey, I give you one more chance. Refuse at your peril.'

'I do refuse,' Sir Geoffrey answered icily. 'Do your worst.'

'That is your decision?—And now, as to these groundless accusations you have brought against me. You have made them; prove them.' He turned to Lucrece with a gesture which was almost noble, all the actor's instinct aroused in him now. There was one desperate chance for him yet.

'You had best take care, if I accept you at your word.'

'I wish to be taken at my word. I demand your proofs!'

'And you shall have them!' Saying these words, Lucrece glided swiftly from the room.

An awkward silence fell upon the group. Le Gautier was the first to speak. There was a kind of moisture in his eye, and an air of resigned melancholy on his face. 'You have misjudged me,' he said sorrowfully. 'Some day, you will be ashamed of this.—Sir Geoffrey, you are the victim of a designing woman, who seeks, for some reason, to traduce my fair fame. If I have a wife, let them bring me face to face with her here.'

'You have your wish, Hector, for I am here!'

Le Gautier bounded forward like a man who has received a mortal hurt, and gazed at the speaker with glaring eyes. Valerie was standing before him, not without agitation herself. A low cry burst from his lips, and he drew his shaking hand down his white damp face. 'What brings

you here?' he asked, his voice sounding strangely to his own ears, as if it came from far away. 'Woman! why do you come here now, to destroy me utterly?'

She shrank haek—an eloquent gesture to the onlookers—a gesture seven years' freedom from thralldom had not obliterated. 'You wished to see me. Lo! I am here! Turn round to your friends now, and deny that I am your lawful wife—deny again that you have ever seen me before, and put me to the proof.—Why do you not speak? Why do you not show a little of that manhood you used to have? Strike me, as you have done often in the times gone by—anything better than standing there, a poor, pitiful, detected swindler—a miserable hound indeed!'

There was a dead silence now, only broken by Le Gautier's heavy breathing, and the rustle of his sleeve as he wiped the perspiration from his face.

'There is the proof you demanded,' Lucrece said at length. 'We are waiting for you to deny the witness of your eyes.'

But still Le Gautier did not speak, standing there like some stone figure, his limbs almost powerless. He raised his head a moment, then lowered it again swiftly. He tried to articulate a few words, but his tongue refused its office.

Sir Geoffrey laid his hand upon the bell. 'Have you nothing to say?' he asked.

'I—I— Let me go out—the place is choking me!'

Sir Geoffrey rang the bell sharply. 'Then this interview had better close. It has already been too long, and degrading.—James, show Monsieur le Gautier out, if you please.—I have the honour to wish you good-morning; and if we do meet again,' he added in a stern undertone, 'remember, it is as strangers.'

Le Gautier, without another word or look, left the room, Lucrece following a moment later, and leaving Valerie away. Isodore stepped out from her hiding-place, her face alternately scornful and tender.

'We owe you a heavy debt of gratitude indeed!' Sir Geoffrey exclaimed warmly. 'It is extremely good of you to take all this trouble for mere strangers. Accept my most sincere thanks!'

'We are not quite strangers,' Isodore replied, turning to Enid. 'Lucrece told you who she was; let me tell you who I am. I have never met you, though once I hoped to do so. I am Genevieve Visci!'

'What! Signor Visci's sister—the girl who—who?—'

'Do not hesitate to say it. Yes, Isodore and Genevieve are one. Out of recollection of old times, when you were so kind to my dear brother, I have not forgotten you, knowing Le Gautier so well.'

'But Lucrece, your sister, to come here as my maid. And Le Gautier—how did you know? I am all at sea yet.'

'It is a long sad story, and some day, when I know you better, I will tell you all, but not now. But one thing, please, remember, that come what will, Le Gautier cannot harm you now. He may threaten, but he is powerless. I have only to hold up my hand!—'

'And Frederick—Mr Maxwell?'

'Do not be impatient. You will see him to-morrow; for this evening I have need of him. You have not the slightest grounds for anxiety. Le Gautier will never harm any one more.'

'How strangely, sternly, you speak,' Enid replied.

Isodore smiled. 'Do I? Well, you heard what Lucrece said, and I may have planned a little retaliation of my own. The eastern eagle flies slowly, but his flight is sure. Trust me, and fear not.'

Enid was bewildered. But the time was near when she was to understand.

With baffled fury and revenge raging in his heart, Le Gautier turned away in the direction of his lodgings, anywhere to get away from himself for a time, nothing left to him now but to wreak his vengeance upon Sir Geoffrey in the most diabolical way his fiendish ingenuity could contrive—and Isodore. By this time, Maxwell was no more; there was some grain of satisfaction in that; and he had Marie St Jean to fall back upon.

He sat brooding in his rooms till nearly nine—time to attend the meeting of the League, the last one he determined that should ever see his face. Had he known how fatally true this was, he would have faced a thousand dangers rather than gone to Gray's Inn Road that night. It was nearly ten when he lowered his gas, and struck off across the side streets in the direction of Holborn. When he reached his destination, he walked up-stairs, the only arrival as yet. Had he been less preoccupied, he would not have failed to notice the glance bestowed upon him by the custodian. He lingered about the room till one by one the company came in.

They were not long in commencing business. Le Gautier did not occupy the chair on this occasion; the proceedings of the evening were important, and a Supreme Councillor was present. He greeted each man coldly. To Le Gautier his manner was stern to the last degree. The routine commenced, and was conducted quietly for some time in the briefest, dryest fashion. Then the president for the evening rose, and taking from his pocket the gold moidore, commanded every one there to throw his upon the table. Presently, nine golden coins glittered on the green baize. 'One short,' the president said sternly. 'Whose?'

They looked round, each waiting for the other to speak.

'It is mine,' Le Gautier exclaimed. 'I did not think it necessary.'

'You have no right to think; it is not in your province. If you have in any way parted with it—' He stopped significantly, and Le Gautier hastily intervened.

'I humbly beg your pardon. I will fetch it immediately. I have not far to go; I can return at once. In justice to myself, I am sure you will permit me to fetch it.'

'No!' thundered the Chief Councillor with a glance in Le Gautier's face that made his heart beat thick and fast. 'And as to justice, you shall have it presently, to the uttermost scruple.—Gentlemen, there is a traitor present!'

With one accord they sprang to their feet, suspicion and alarm in every eye.

'Who is it?' they cried. 'Death to the traitor!'

'Look round among yourselves, and see if you can discover him.—No! Then he wears a good mask who has a hard conscience.—Stand up, traitor!—ay, the most despicable; stand up, and look us in the face! Who is the man who has enjoyed our deepest confidences—the man we have to thank Isodore for discovering?—Stand up, I say! Rise, Hector le Gautier!'

The Frenchman knew his last hour had come; he knew that such a hold accusation as this could not be made without the most convincing proof. But despite his failings, he was not the man to cower before such a great danger. He braced his nerves till they were like steel; there was no particle of fear in his face as he turned at bay.

'I had expected something like this,' he said. 'It is not likely that my promotion should pass by without incurring some jealousy. I will say nothing about my long services, the years I have spent in the service of the League. My accuser, and your proof!'

A murmur of applause ran round the table at this sentiment. There was no appearance of guilt here.

'Isodore is your accuser—the proofs she holds. You are charged with conspiracy to overthrow the League, in conjunction with another person. Your companion is one Marie St Jean.'

Even with his iron nerves under control as they were, Le Gautier could not repress a start, which was not lost upon the Councillor.

'Marie St Jean,' he continued, 'received from you certain papers for the purpose of handing them over to the police. The information contained therein is complete. Do you deny your handwriting?'

He threw a bundle of papers across the table to Le Gautier. As he read them, his white face became corpse-like in its livid hue. But he was fighting for his life now, and summoned all his self-command to his aid, knowing full well that if he was condemned, he would never leave that room alive. His calm air came back to him.

'I admit the handwriting—private memoranda stolen from my apartments. I am still waiting for your proof. Besides, Marie St Jean is a member of the League; she restored to me'—

'Your insignia, which you had the temerity to stake upon the colour at Homburg.—Salvarini, I call upon you to say if this is not so?'

'I would rather say nothing about this,' Salvarini said. Le Gautier noticed how distressed and agitated he was. 'I fear—I much fear you have too much proof, without calling upon me.'

'You stand by a friend, Luigi!' Le Gautier said bitterly. 'Do not think of me now. Every man must look to himself!'

'Sufficient of this,' the president interrupted. 'My proofs are overpowering. You are charged with packing the cards, to force the Brother Maxwell upon a dangerous mission.'

'Enough!' the prisoner exclaimed; 'confront me with my accuser!'

'You shall see her.—Isodore!'

As he raised his voice, a breathless hush fell upon the assembly. Presently, a woman entered; for a moment she looked at the group, and then raising her veil, showed her beautiful face.

'Marie!' A deep, bitter cry, following this word, burst from Le Gautier's lips, and he fell forward upon the table, his head upon his hands. There was no escape now, he knew full well. And the woman he thought had loved him—the woman who knew all his plans to the letter, was the Princess of the League, the most dangerous member, Isodore herself! Salvarini looked into her face for a moment, and then whispered one word—Genevieve; but she heard it, and smiled at him, pleased that one man should remember—heard the little word which struck a womanly chord in her heart, and was thankful. Then she made him a sign to be silent.

Stunned by the crushing force and suddenness of the blow, Le Gautier half lay there, with his head resting upon the table, no sound breaking the solemn silence. The president addressed the wretched man, asking him if he had anything to say.

He raised his head and looked dazedly around, then down again. 'I? No! I have nothing to say. My doom is sealed!'

'Bind him!'

Tough hands were laid upon the doomed wretch, and fastened him in his chair securely, taking care to make his bonds too tight for escape. Le Gautier did not resist; he knew now that there was no escape in all the wide world for him. They left him thus, trooping in to an adjoining room to go through the mockery of the trial which the orders of the League demanded.

When Le Gautier looked up, he was alone, save for Isodore. 'You are satisfied with your work now?'

'Yes, I am satisfied now,' Isodore echoed. 'So you thought to play me off against Enid Charteris, poor fool! Hector le Gautier, I am going to tax your memory. Do you remember one evening in the Mattio woods when you abandoned a lonely trusting girl, the sister of your friend? Do you remember lunging at a vow of vengeance five years ago? Justice is slow, but it is sure. Do you remember?'

'Yes. Is it possible that you can be?'

'Yes, it is possible, for I am Genevieve Visci! It is my turn now.' And without another word she left him.

Presently, a desire to live took the place of his dull despair. In an agony he tugged and turned, cutting his wrists with the keen rope till the blood ran down his hands. He could hear the low monotonous voices from the adjoining room, the hurrying footsteps in the road below; and only that thin wall between himself and safety. Even the window leading from the iron staircase was open, and the evening breeze fanned his white despairing face. He struggled again till his heart nearly burst, and then, worn out, broke into tears.

'Hector!'

He turned round, hardly certain whether it was a voice or a fancy. Gradually out of the mists a figure emerged, and creeping stealthily across the bare floor, came to his side. It was Valerie.

'So you have come to gloat over my misery too,' he whispered hoarsely. 'Go, or, manacled as I am, I shall do you a mischief.'

For answer, she drew a knife from her pocket, and commenced, with trembling fingers, to sever

his bonds. One by one the sharp knife cut through them, till at length he stood a free man. One grudging, grateful glance at the woman, and he disappeared.

CHRISTMAS IN A DĀK BUNGALOW.

I HAVE spent Christmas Day in England and abroad, in my own family, in mess, and with three commanding officers; but till the year 1883, I had never spent one absolutely alone. I had on this occasion another opportunity of spending this day in mess, for I was in India at the time; but I came to the conclusion that a bird in the hand is worth two in the bush; and three days' leave for certain is better than a fortnight's in prospect; and having had rather a trying share of work for some time before Christmas, I decided to forego the usual 'going round the men's dinners,' with its concomitant drinking of curious and, I hope, rare liquors, eating pieces of Christmas pudding, and subsequently getting through the day in a manner more Sunday-like than actually amusing. So, on the 23d December I found myself about seven p.m. in the dāk bungalow of a river-side station in the Punjab, to which I had been recommended by a messmate as a good spot for a few days' duck-shooting. My servant, a Madrasi, rejoicing in the name of Zacharias—the 'Madrasi-man every time liking Christian name, sah'—had preceded me, and had got the principal agent for my three days' shooting in the shape of a shikaree, who bore the very unchristian name of Rukkam (Rook'em) Deen, in attendance to make arrangements for the morrow.

Now, I am not going to enter into a discussion on the subject of duck-shooting, for many reasons, of which I will mention, first, that I might have conducted such operations on any other three days of the year, if I could have got leave; second, that I am not very proud of my own prowess with a gun; third, that I didn't get much, though I saw a great deal; and fourth, that the subject of wildfowl shooting is not one to enter into in a light and frivolous spirit, but must be approached with awe, and with a due appreciation of nice distinctions of weights and measures, and a ready desire to hear all manner of extraordinary asseverations, however fond of truth the listener may be. Mine is a true story, and is only a collection of jottings and thoughts. After this explanation, I can safely skip over my doings on the 24th, which were confined solely to the region of the river and the somewhat distant society of the wildfowl.

Christmas Day opened fine and clear. That is a matter not of much note in India, where the weather is remarkable for its succession of fine clear days; but in England, Christmas Day—if my recollection serves me true—does not always open fine and clear. I was called at half-past six A.M.; and by eight had put my cartridges together, dispensed with a tub, had breakfast, and started for the river again. Outside the dāk bungalow, as luck would have it, I met an Englishman—a terrible thing on the continent, I know; but somehow in India we are not so painfully exclusive. I wished him good-morning and the compliments of the season; he returned

the sentiments; and that was all the conversation I had with a fellow-countryman on that day. I was on the river from half-past eight till four; but skip that period for the third of my reasons for making this no wildfowler's story. Soon after getting in, cleaning my gun, having my tub, and generally assuming a more civilised appearance, I heard the church bells ringing; and hurried off to find a children's service being conducted by a very nice, benevolent-looking clergyman, who had for his congregation about twenty children and a round dozen of adults, parents and so on. The reverend gentleman was giving the children a simple address as I entered, and I felt at home and happy. The little voices joined in singing hymns and saying prayers; and when the lines, 'Guard the sailors tossing on the deep blue sea,' were sung, I let my thoughts wander over a good many leagues of land and sea to where others were, as I felt sure, thinking of me in the midst of their Christmas doings.

On my return to the bungalow, I found that there was an Englishman living under the same roof, and felt that I should very much like to have a companion at my dinner. I accordingly sent Zacharias to find out who the Englishman was and what he was doing here; for I did not want to bore him with an invitation if he had come here for the express purpose of being alone with his thoughts. I imagine my faithful valet found the inquiry difficult of prosecution, or, what is more likely, that he gave it up in favour of seeing 'master's Christmas dinner' being properly cooked. Anyway, it was not till Zacharias brought me my soup that he brought the intelligence that 'the English gentleman having joint;' so my intentions were frustrated, and the only attention I could pay the mysterious stranger was to send him the following note:

DĀK BUNGALOW, Christmas Day.

DEAR SIR—I should be very proud if you would accept a glass of wine from my bottle, which I send by bearer, and drink with me to Absent Friends. I am very sorry I did not find out till too late that there was an Englishman in the bungalow, or I would have done myself the pleasure of asking if you would care to dine with a fellow-countryman on this occasion. Hoping you will excuse my intrusion, I am, sir, with all the compliments of the season, yours truly,
H. S.

I sent him at the same time an open bottle of 'Sparkling Wine,' and soon after received my bottle back, with but very little gone, and at the same time the following answer:

DEAR SIR—Thanks very many. A merry Christmas to you. I drink your health.—Yours sincerely,

I am very sorry I cannot put in the name of an eminent politician or other dignity, by way of completing the story; but as I couldn't read it, my curiosity must remain for ever unsatisfied, and the mysterious stranger of Christmas Day, 1883, will remain wrapped up in his mystery, unless he chances to peruse these lines, and, remembering the incident, discloses himself.

As for my Christmas dinner, I must say it was as good as any government establishment, and

much better than most dāk bungalows could produce. The hand of Zacharias was betrayed in potato chips and cunning sauces. I can here fairly bring in that I had a duck of my own shooting, and the only thing wanting was bread. The forgetful *khanamah* or housekeeper had not warned the native baker, and I had to make the best I could of *chupatties*, a poor substitute; and I am convinced that its permanent institution on the English diet table would soon reduce us to a very low ebb indeed. But being in a properly Christmas frame of mind, good-will to all men, &c., I determined to make the best of a bad business, and toasted them before a wood-fire, thus giving myself an opportunity of introducing to Zacharias' notice, à la Mr Barlow, of *Sanford and Merton* fame, 'The Story of King Alfred and the Chupattie, or the Indigent Monarch and the Haughty Swineherd's Wife.' Wishing to be understood, I endeavoured to put the simple narrative in a somewhat Indianised language, and the following was the result:

'One time in Englishman's place, one King Alfred living.—Do you understand "king?" Mr Queen *subee burra rajah*' (the biggest swell of all).

Zacharias. Yes, sah.

'One time Alfred Sahib young man, and wanting to study how the newly franchised ones would vote.—No; I mean liking to see how his people's getting on *malikam*.—Do you understand?'

Zach. Yes, sah.

'Very well; he went to house of ono man looking after pigs (*Suir ke kuberderwallah*). That right?'

Zach. Yes, sah.

'Pigman's wife not knowing Alfred Sahib have much *Burra Bahadur* (Great Unjandrun), giving him some chupatties to toast before fire, same like Master doing now. Then pigman's wife going out to see pigs. Alfred Sahib besides being king of England, was a bit of a *Bajawal* (music-man). When pigman's wife going out, Alfred Sahib playing on his *baja* same like Master on banjo. Chupatties getting burned; pigman's wife coming back, getting plenty angry, then stick-striking (*Lackri-marta*) Alfred Sahib.—Now, Zacharias, you understand all that?'

Zach. Yes, sah.

'What do you understand?'

Zach. Master not liking raw chupatties.

'Yes; and I would take this opportunity of impressing on you the many advantages to be gained by entirely giving up chupatties in favour of bread. Look at that piece of garbage I have got to eat! I warn you that so long as you and your fellow-men in India continue to eat chupatties and such-like nastiness, so long will you remain in that state of degradation and darkness that England was in, in the days of Alfred Sahib.—Do you understand?'

Zach. Yes, sah.

After this expression of sentiment, I went to dinner, and really enjoyed my toasted chupattie, as I had converted it into a sort of ship's biscuit, than which there is nothing better. When I felt the influence, benign and benevolent, of doing myself well, creeping over me, I was at the stage of my first glass of wine, and this was a bumper to Absent Friends. What a host of faces passed before my eyes as I shut them and

quaffed the time-honoured toast! How I could have moralised, and become sentimental and maudlin! But as that was not my intention at all, I wished all the dear good souls the 'Best of luck'—lots of it, and may I soon be there to see! and resumed my lessons in civilisation to Zacharias. I never before appreciated so thoroughly what a capital thing it is to have an English-speaking servant in India. Did I say English-speaking? I am afraid I did; but English-understanding would be a better expression, for I never gave Zacharias a chance of speaking till after dinner, when he came in capitally. I told him how shameful it was that his fellows would use the poisonous *debatkai* (cooking-pot), with its bi-monthly demand for tinning or for a substitute 'leading,' when kind English people tried to introduce the more familiar saucepan of iron and enamel. I told him how much better a slow-burning moderate fire was for cooking purposes than the pot-destroying furnaces of charcoal over which everything is cooked in India; how nothing was cooked through, but everything sodden inside and burned outside. I ingratiated myself again by drinking his health. I then attacked him on another point, and told him confidentially that if it was not for his fellows' silly ideas on the subject of caste, that we should never have taken the country; and was rather glad that he put a stop to this unwise disclosure and counsel by saying: 'God is good, sah. Gentlemen never knowing why caste, and not liking.'

At last I finished dinner; and then gave a few directions for the morning—to be called at half-past six, to have breakfast ready at seven A.M., and to shut up rooms and come with me. But the demon of speechifying was on me, the *caecoths loquendi*, and nothing under an eighteen-hundred horse-power steam fire-engine could quench the raging fire that had mastered the movements of my tongue. The only consolation was that I gave Zacharias more chances. I asked him questions. 'When Master going to the war' (there was none in prospect), 'what will Zacharias do?'

'I will always come with Master. Master good to me, sah.'

'Has Zacharias ever heard of Russian peoples?'

'Yes, sah. I was always hearing when I was little child in *i-school*, Russian peoples coming—never come. God is good, and Russian peoples bad peoples. If Russian peoples coming, then Queen's peoples putting them back to their own land; but never coming, sah.'

'But the Baboos say they are not well treated sometimes; and they make a lot of bobbery, and do plenty bad talking, and not liking English peoples. I tell you, Zacharias, if the Russian people came, the Baboos won't have a chance of holding their silly meetings; they'll be put to clean the Russian gentlemen's backyards, and do all the dirty work that can be found for them.'

'Yes, sah. These Baboos are fools. If English gentlemen not coming, where is go? Baboo? Only Bengal people talking that way. Madras peoples always right.'

'Bravo, Zacharias! Here's a toast to Madras, the benighted presidency, and may she always have as staunch countrymen as you!'

'Thank you, sah.'

'But about these Russians—tell me some more.'

'Russian peoples got no money; Queen got plenty money. English soldiers plenty strong, so Russian peoples not coming.'

'That's right. You stick to that; and when you hear the silly Baboos saying they are down-trodden, you tell them, with my compliments, that they are a pack of fools, and that they had better not wait for anybody else to tread on them, when they hear the *Sahbhlogues* [Englishmen] are going.'

'Yes, sah; that is right. If English peoples not coming here, I would never be wearing such clothes as these.' (Zacharias is very well pleased with himself when he has got on his clean dinner clothes, as he had, to celebrate Christmas Day of 1883.)

'Now, you understand what I say, eh?'

'Yes, sah.' (Here came the crushing blow, the long-deserved snub to my loquacity.) 'Master wants calling at half-past six, and breakfast at seven.—Good-night, sah.'

I couldn't help but take a hint so gently given; and so, bidding my faithful Zacharias—I sincerely believe he is faithful—'good-night,' I knocked the ashes out of my pipe, and brought to a conclusion my Christmas Day.

A NOVEL ADVENTURE.

It was always my conviction that a Briton ought never to go abroad to seek beautiful scenery until he had travelled all over his own country, and accordingly in early manhood I made a series of walking tours until I had seen every variety of English, Welsh, Scotch, and Irish scenery. It was in the course of one of these tours that I came across the pretty little village of Fernville. Little softly undulating and beautifully wooded surrounded the place; while two large ponds and numerous brooks supplied fishing enough to satisfy the wants of even an ardent angler like myself. The village was one of those little places where the population seems never to increase and the trade of the builder to be unknown. Visited by few strangers, this secluded village was just the kind of place for a traveller to rest himself and recruit. Here, then, I resolved to take my ease until such time as I felt disposed to resume my journey. The village inn afforded comfortable quarters, and here I ensconced myself, filling up part of my time in posting up my diary and writing to relatives and friends, matters which I had very much neglected. Much of my time was spent, too, in taking long rambles into the country and exploring the district for miles round; often, too, I took my fishing tackle with me, and seldom returned empty handed.

One day, when I was about setting off on one of these rambles, a young fellow arrived at the inn, having had apparently a pretty long walk. He had started, he said, early that morning from the town of B—, purposing to reach C— in the afternoon; but having taken what he understood to be a short-cut, he had lost his bearings—a thing people often do when they take 'short-cuts'—and now found himself some twelve miles from his destination. From what

he said, however, I found that it was not really necessary for him to be in C— before the next day; and as he seemed an agreeable and companionable gentleman, I suggested that he should keep me company for the rest of the day, sleep at the inn that night, and resume his journey next morning. This he agreed to do; and my bedroom having two beds, it was arranged that he should share it with me.

Half an hour's conversation with my new acquaintance confirmed my good opinion of his sociable qualities, and I congratulated myself upon the agreeable companionship I had secured for the better part of a day. We dined together, and then set out for a stroll, returning in time for supper, well pleased with each other's society; at all events, I was charmed with my companion, his light-heartedness and extreme vivacity coming as a refreshing and an agreeable change after the rather dull company of the few villagers whose acquaintance I had cultivated. A chat and a pipe followed supper, and then, in good spirits, we retired for the night.

As was usual with me, I was soon lost in slumber; but after being asleep for what seemed a considerable time, I found myself awake and dimly conscious of some one moving about the room. The day was beginning to break, and sufficient light penetrated through the window-blind to render objects in the room dimly visible. My ideas were at first hazy, and no recollection of my companion crossed my mind; hence I concluded that I was alone in the room with this burglar, as I took him to be, and I resolved to watch him quietly. His back was towards me; but he turned suddenly, and as the feeble light from the window fell across his face, I recognised my companion of the previous day. His expression was wild and savage, and in his right hand he held a large, long knife, with which from time to time he struck fiercely at the empty air, muttering rapidly words of which I could not catch the import! I am not a timid man, but I must confess that a kind of sickly feeling came over me as it flashed across me that I was alone with a lunatic, and that, too, at a time when, the rest of the household being asleep, the chance of any help was very remote. To be alone in bed at night while an armed burglar is prowling about the room, is bad enough; but when, in place of the burglar, you have a madman, the case is infinitely worse; an attack might be made at any moment, and without the least provocation.

My mind reviewed rapidly the incidents of the previous day. I had noticed nothing in my companion's demeanour which would lead any one to suppose he was insane. True, I had been struck with his vivacity, and rather astonished at the rapidity with which he would pass from one topic to another; but this had simply pleased me as a trait of originality. Through my half-opened eyes, and by the increasing light, I now saw him suddenly pause in his movements, bend forward, and gaze half eagerly, half hesitatingly in my direction. My heart nearly ceased to beat. 'Would he come forward? He advanced quickly a couple of steps, his face lighted up with a fiendish anticipatory pleasure; then he stopped for a moment. Should I spring from the bed and rush upon him? There was still

about half the length of the room between us. No; the distance was too great for me to take him by surprise. He again came quickly forward, stood for a moment by my bedside, and then, with a savage scowl, the knife was thrown back to strike. But before it could descend, I had darted from the bed and was upon him, my left hand grasping his right wrist. 'Madman!' I hissed, as I forced him backwards, 'drop the knife!' In another moment we had fallen heavily, he undermost. His leg had caught against his own bed, and my weight had forced him backwards. In falling, his head struck against a piece of furniture with sufficient force to stun him. I took advantage of this to possess myself of the knife, which I had scarcely done when he opened his eyes. I planted myself firmly, expecting that he would renew the struggle; but, to my surprise, he burst into a laugh, and at length exclaimed: 'Well, I have made a fool of myself, I must admit. I am no more mad than you are; and I am sure I have no designs against your life, however suspicious things may appear. Loose me, and I will explain all, although I know that in doing so I shall lay myself open to your ridicule.'

The laughter was so hearty and the tone so genuine, that I complied; besides, I had the knife if the worst came to the worst.

'The fact is,' he commenced, 'I am stage-struck (don't laugh at me more than you can help). I wanted to go on the stage, but to this my father strongly objected. The craze was, however, too strong upon me to allow of my quietly giving up the idea, and at last the opportunity of realising my ambition presented itself. Near our town is a small place where there is a little theatre—a poor affair, and visited only by third or fourth rate companies. Well, I made acquaintance with a party of travelling players there, and one of their number having left them, it was arranged that I should take his place at the next town they visited. I was walking on there, when, getting rather out of my course, as you know, I met you. I had expected being alone last evening and going over my part in private; but, of course, your being with me stopped that. I woke very early this morning, and being full of anxiety to make sure of my part, and imagining you to be fast asleep—as I believe *now* you really were at first—I could not resist the temptation of trying a rehearsal *sotto voce*. In the play, I have to murder my rival in his sleep; and your lying there in bed gave such a realistic air to the thing, that I could not resist going through my part of the play with you as the rival, seeing you were, as I thought, safe asleep. Judge, then, of my feelings when, without a moment's warning, you suddenly sprang upon me! Surprised and confused, I knew not for the moment what to do; but before I could collect myself, I had stumbled and fallen; and I suppose I must have been stunned, for I remember nothing more until I found myself on the floor, with you kneeling upon my chest, and looking quite prepared for a deadly struggle.—Now, you know all, and I hope you are none the worse off for the little adventure than I am.'

My answer was that I was only too glad

the affair had terminated in so peaceable a manner, and that my sleeping companion, instead of being a lunatic, was only afflicted with a mania for the stage. I added, that I hoped the incident might cure him of the craze. And so it did. My companion did not appear on the professional stage, though I have often seen him to advantage in private theatricals, and have frequently watched him rehearse, but never with the same uncomfortable feelings as I did that night at the village inn.

SOME ASPECTS OF CANADIAN PROGRESS.

For those who cannot actually travel over the Canadian Pacific Railway from Montreal to Vancouver, in British Columbia, perhaps the next best thing is to look through the eyes of the *Times* correspondent, whose 'Canadian Tour' has just been reprinted from the columns of that journal. Progress in the North-west is so rapid, that even this journey, performed quite recently, will soon grow antiquated; but many of the particulars are so full of interest for all who are concerned in the progress of the Canadian Dominion, that we make no apology in gleanings the most important facts therefrom, and from other sources, for the general reader.

The completion of the Canadian Pacific Railway has been the signal for embarkation in other comprehensive designs for opening up and furthering the interests of the Dominion. The Hudson Bay Railway, running from the heart of Manitoba to Port Nelson, on Hudson Bay, is proceeding apace, and will open up a region hitherto almost shut out from communication with commercial centres, besides giving an opportunity of testing the feasibility of the proposed short sea-route from Canada to Liverpool. This route by way of Hudson Bay, which will save about one thousand miles as compared with the Quebec route, has been reported upon by officials on behalf of the Canadian government, and the various reports agree that it will be navigable for four months of the year at least.

In the last session of the Canadian Parliament, an Act of Incorporation was passed on behalf of a new railway scheme to be called the Winnipeg and North Pacific Railway. Starting from Winnipeg, it has been planned to run in a north-westerly direction, bending to the west, and to strike the Pacific Ocean at Port Simpson, a point which is said to be four hundred miles nearer Yokohama than Vancouver, the present terminus of the Canadian Pacific. The country to be passed through is highly fertile, with great mineral wealth; and it is expected that this saving in distance will tell in its favour.

Meantime, the trade arrangements of the Canadian Pacific seem to meet with growing favour. Mr Everett Frazar, who has been concerned in more than one shipment of tea from China and Japan by this new route, reports that tea-importers in Canada and the United States are more than pleased with the quick despatch given to their orders, and the excellent condition in which consignments have reached them. One result has been that Chicago is rapidly overtaking New York as a tea-distributing centre.

Yokohama being about five hundred miles nearer the western terminus of the Canadian Pacific than to San Francisco, two or three days can be saved by the Dominion route. The total tea imports for the season by the seven vessels already chartered are reckoned at 7,878,033 pounds, of the value of half a million pounds sterling. Suitable docks and wharfrage have been prepared at Vancouver for the growing trade, and a fine three-story stone and brick hotel, which will be open for guests in the spring, is being erected.

The main characteristics of the line are thus described by the *Times* correspondent. The first three hundred and fifty miles, carrying the line westward from Montreal to Lake Nipissing, is through old and well-developed country, commanding the timber traffic of the Ottawa River valley. For the next one thousand miles to the edge of the great prairie east of Winnipeg, the country passed through has extensive forests, and lands abounding in copper, iron, and silver. For nine hundred miles westward of Winnipeg there is a flat or rolling prairie, which is being rapidly settled, and which comprises some of the richest agricultural soil in the world. Nearly the entire length of the land-grant of the railway is already located here. This rich soil extends to the base of the Rockies. The railway now passes over a rough country, through mountain ranges, with immense forests, and splendid scenery. The best materials have been used in its construction throughout; the bridges and trestles are built in the strongest possible way; and the arrangements for traffic are efficient. The manager of the line told the *Times* correspondent that he could at present undertake to transport eight thousand armed men a day from the Atlantic to the Pacific, should any Eastern complication render this necessary.

The distance from the eastern terminus at Montreal to the western end at Vancouver is two thousand nine hundred and nine miles, or three hundred and sixty-two miles less than the line between New York and San Francisco. From Liverpool to Vancouver by the Canadian Pacific route is five thousand one hundred and sixty miles. Across the Pacific Ocean to Yokohama, by the Canadian route from Liverpool, is nine thousand five hundred and forty-six miles, or eight hundred and eighty miles less than by the New York and San Francisco route. The traveller may choose the all-rail route westward, round the northern shore of Lake Superior, or by way of Owen Sound and Lake Superior, in the new steel-steamships, the *Alberta* or *Athabasca*.

No city in Canada has grown with greater rapidity than Winnipeg, the capital of Manitoba, which has now from twenty-seven to thirty thousand inhabitants, and no part of the country owes more for its development to the railway than the Red River Valley. Butter, cheese, vegetables, fruit, and grain, are now exported in large quantities. To further open up the prairie region, an elaborate network of branch railways has been arranged for, and town-lots have been laid off in connection therewith. The Manitoba and North-western Railway runs north-west from Portage La Prairie towards Prince Albert.

Regina, the capital of the North-west, stands on the Pile of Bones River, a tributary of the

Qn'Appelle River, one thousand seven hundred and seventy-nine miles west of Montreal. This place, of three hundred houses and not more than one thousand people, is the residence of the Governor of the North-west. Our correspondent likens the present appearance of the place to a section cut out of the middle of the Atlantic Ocean, with a few scattered rows of wooden houses set down upon it. In a little square-built brick courthouse, outside the town, Louis Riel, leader of the late rebellion in the North-west, was tried, and afterwards hanged at the barracks, about two miles off. Here are the headquarters of the mounted police, the constabulary of the North-west, the entire force consisting of about one thousand men.

There are few places of any importance westward of Regina; the villages and settlements are as yet in their infancy, and we hear such grotesque names as 'Moose Jaw,' 'Swift Current,' and 'Medicine Hat.' The large cattle ranges of Canada are situated in the south-western portion of the province of Alberta, Fort MacLeod and Calgary being two great centres for the ranchmen. Experienced cattle-men have pronounced the eastern slope of the Rockies as furnishing the best grass and water for large herds, in Western America. The winter there is less rigorous than in Manitoba and the older provinces. When the Canadian Pacific reaches Calgary, it runs along the valley of the Bow River, and crosses the summit of the Rockies at an elevation of five thousand five hundred and sixty feet.

At Donald, past which the Columbia River flows with a swift current, house-building is going on for the settlers, who at first had to live in tents and cabins. This place is destined to be an extensive settlement, with railway repair shops. The surface is covered with forests, except where clearings have been made. On leaving the Columbia, the railway turns sharply to the south, into the cañon of the Beaver River, a stream which rises from the centre of the Selkirk Range. As the railway rises, all the slopes of the mountains are seen clad with timber, and sawmills are busy. Trestle-bridges span the gaps made by tributary streams, and one of these is two hundred and ninety-six feet high, and four hundred and fifty feet long. The great mountain ranges of the Selkirk passed, the Gold or Coast Range comes next, where the traveller finds himself amongst the better-settled districts of British Columbia.

Kamloops, a place of fifteen years' growth, at the junction of the North and South Thompson Rivers, is a prosperous town, with English residents living in the centre, and the Chinese at either end. Burrard Inlet lies to the north of the Fraser River, and here, at Port Moody, the finished line ends at present. But an extension to Vancouver, at the sea-entrance of Burrard Inlet, is being made, and will be finished next year. There are several settlements on the banks of the Inlet, where timber-mills are at work. One place is an Indian mission settlement, and has three hundred inhabitants.

Vancouver, the western terminus of the Canadian Pacific Railway, has a very hopeful outlook at present. Being a wooden town, it was

almost entirely burned in June 1886, but is now recovering from that serious fire. Streets are laid out, a substantial wharf has been built, and the trade in town-lots is described as brisk. Much of the cleared surface of the town is covered with stumps of the 'big trees,' spruce, pine, or cedar, which grew there; it costs from one hundred to one hundred and fifty pounds per acre to clear the ground of these stumps. One large pine, standing solitary in the town, was saved on the intercession of the Princess Louise, and has been rightly named after her. The Vancouver chief of police is a gigantic Highlandman, with a force of five men under him. Wood-cutting is the chief industry of this section, and Vancouver as a terminal city has great commercial possibilities.

In conclusion, the *Times* correspondent does not hesitate to confirm the statement, that the Canadian Pacific Railway has 'more good agricultural land, more coal, and more timber, between Winnipeg and the Pacific coast, than all the other Pacific railways combined, and that every part of the line from Montreal to the Pacific will pay.'

WAS IT MURDER?

I HAVE thought it over and over, and cannot come to any definite conclusion. Was I justified in killing the man? If I was, I am a benefactor to some of my fellow-creatures; if I was not, I am a murderer. My readers shall have an opportunity of judging, and I hope their judgment may be lenient.

Some years ago, I was well off, and received the education and bringing-up of a gentleman; but partly through my own folly, and partly through unfortunate speculations, I gradually lost all my capital; and about two years ago I found myself penniless, and saw starvation ginning at me within measurable distance. Then I determined to attempt no longer to keep up appearances, but to try and earn a bare existence in any walk of life that was open to me. After some fruitless efforts and a good deal of the 'hope deferred' which 'maketh the heart sick,' I obtained, through the kindness of a gentleman connected with the Great Junction Railway, the position of stoker. I never was given to drink, so that I was well enough able to fulfil the lowly duties of my position. I am now a station-master; and it is during my few hours of leisure that I prepare this plain narrative for the decision of a discerning public.

It is a great point for a stoker to be on good terms with the engine-driver, and I generally found little trouble in making friends with my nearest travelling companion.

On the day when I went through the most disagreeable experience of my life, I was travelling from Paddington to Cowhester on the well-known—to railway employees—engine named 'Pluto.' She is a fine upstanding, bold sort of engine, and when in good temper, does her work right well. The engine-driver on this occasion was a man named John Morgan. I had not often travelled with him before, only two or three times, and I never could get on comfortably with him. He had been many years in the

Company's service, and bore an excellent character for steadiness, but was considered rather taciturn. He seemed to be always in the sulks, and was, I suppose, of a surly temper. Before we started, he hardly answered any remark I addressed to him, and seemed more surly than usual. Once when I took up a cloth to brighten one of Pluto's taps, he called out to me in a savage tone: 'Let her alone, can't you. I'll make her travel to-day without your bothering.'

I made him no answer, as I did not see the good of having a quarrel in the small space we were confined to. The train was to start at twelve noon, and before that time, we on the engine were all ready; but it was a quarter past twelve before we got the signal to move. There was such a crowd of people of all classes on the platform, that room could hardly be found for them in the train. However, at last the head-guard gave us the signal, and Morgan turned the handle, and we moved slowly and steadily out of the station. When we got well out into the country, Morgan turned to me and said shortly: 'More coal.'

Now, in my opinion, no more coal was wanted, as there was quite enough in the fire to keep up the usual speed. However, as a stoker, I was only an underling, and must obey reasonable orders. So I stoked as bidden, and then curiously watched to see if the engine-driver would turn on full speed. He did nothing of the sort, but sat with his back to the boiler, and began to talk to me quite affably. Amongst other things, he said he was quite tired of this perpetual travelling, and that he meant to look out for a wife with a little money, and never set foot on an engine again. There was nothing at this time peculiar in his manner, except that he was more talkative than usual, and he would now and then turn half-round to the engine and call out: 'Get on, old girl, get on!' We had before us a run of an hour and a half, and by that time we were due at Blinton, a big junction, at which every train must stop; so we had plenty of time to talk.

About an hour after leaving Paddington, Morgan stopped suddenly in the middle of a sentence, and said: 'Well, I must get to work now.' Then he opened the firebox door and called out to me: 'More coal.'

I expostulated with him, and pointed out that we were going at a high rate of speed, and would not need more coal before Blinton; but this seemed to excite him terribly. 'Shovel it in!' he roared, with an oath; 'I'm going to make her travel.'

To pacify him, I took up a shovelful, and managed to upset a good deal of it before I reached the firebox.

'You clumsy fool!' he called out; 'here, give it to me;' and snatching the shovel out of my hands, he crammed on as much coal as he could get in.

I was beginning to get alarmed; and looking out over the well-known country—for I had travelled that journey many and many a time before—I saw that we were much nearer to Blinton than we ought to be at that hour. However, I thought it did not much matter, for the line was signalled clear in front of us, and the damage done was, as yet, simply a little

waste of coal. In a few minutes, our speed increased enormously, and I calculated we were travelling at the rate of seventy miles an hour. I thought it was time to remonstrate; and turning to Morgan, I noticed that the indicator showed full speed. I called his attention to the fact, and begged him to reduce the speed, or we should run into Blinton without being able to stop.

'Ha, ha!' he cried in reply. 'Stop! I'm never going to stop again! I told you I'd make her travel. What do you want to stop for!—Get oh, old wench, get on!' Then he burst into a hideous peal of laughter.

A cold sweat of absolute terror broke out on me as I realised the state of things. Here was a raving maniac, a far stronger man than myself, in charge of a train full of people. I bit my lips and clenched my hands, and tried to collect my scattered ideas and decide what was best to be done. Meanwhile, Morgan sat on a rail near the boiler flourishing a shovel and shouting uproariously. The train rushed on with incredible speed, not steadily and evenly, but with leaps and bounds, that threatened to cast the engine off the line at every yard. There was no doubt the man was as mad as a man could be, and he was also master of the situation. I made one effort to reach the handle by which the steam is turned off; but the madman was too sharp for me. 'No, you don't!' he shouted. He brought his shovel down with a tremendous blow on the rail at my side, just missing my head. It was plain I could do nothing by force. Would stratagem be of any use?

I looked out to the country; time was running short; we were not more than twenty miles from Blinton Junction; and if we did not stop there, the whole train must inevitably be wrecked, and probably not one passenger would escape uninjured, and but few with their lives. I looked back to the train. Outside the windows were hands gesticulating, and frightened, alarmed faces. At the end of the train, the guard was waving a red flag. Something must be done, and by me, or we should all be inevitably lost. I made up my mind. I turned to Morgan with a smile on my face, and I said: 'Old boy, you're quite right; this is a fine pace; but it ain't quite fast enough. Look here!' and I caught him by the arm and led him to the side of the engine next to the double rail. 'See!' I cried; 'there is another train coming up faster than us, and she will pass us; we must go faster; but let's see first who is driving her?' I lean forward and look. Can you see?

The poor maniac stepped outside the rail and leaned forward to look for the imaginary train, when I gave him a sudden push, and he fell in a heap on the side-rails and was killed on the spot. With a gasp of relief I sprang back to the engine and turned off the steam. It was not a moment too soon. We were well in sight of Blinton Junction before I had the train properly under control. I pulled up at the platform all right, and then I fainted.

When I came to, I was lying on a bench in the waiting-room, and the inspector was standing over me, with his note-book in his hand, prepared to take down my statement. What I stated

was, that the engine-driver had gone mad, and that, to save the lives of the passengers, I had knocked him off the engine just in time to get the train under control before running into the station. This was corroborated by the guard and several passengers; and the case was brought before the solicitors of the Company. I gave my evidence at the inquest, and heard no more of the matter until one day the passenger superintendent handed me ten sovereigns and a letter appointing me station-master at Little Mudford. It was evident the directors condoned my conduct; and I hope that my readers will agree with them, and, in consideration of my having saved a train full of people, will acquit me of murder, and bring in a verdict of justifiable homicide.

POPULAR LEGAL FALLACIES.*

BY AN EXPERIENCED PRACTITIONER.

DEEDS OF GIFT AND WILLS. II.

THE making of a will is a much less formidable affair than the preparation of a deed of gift. It requires no stamp; the rights of the beneficiaries do not arise until the decease of the testator, and therefore it does not in any way interfere with his power to manage and dispose of his property as he thinks best in the interval during which he retains physical and mental power to make a new will. In a case of extreme simplicity, the testator may even dispense with professional assistance altogether; but this is seldom advisable. As, however, some testators will make their own wills, it may be useful, while adverting to the danger of that practice, to point out how the risk may be lessened. It is always dangerous to use technical expressions—such as ‘heirs,’ &c.—because a gift to the heirs of a testator has the effect of cutting out the younger children in the same way and to the same extent as if he had died intestate. In some cases, it may even be worse than intestacy, depriving them of their shares of their father's personal estate. The intentions of the testator ought to have the simplest form of expression possible applied to their setting forth in the will. The names of the children who are to benefit ought in most cases to be inserted, this having certain legal advantages in case of death over the description of the children as a class. When property is given to a child of the testator who dies before his father, the gift takes effect as if he had survived his father and then died; while in all other cases, if the beneficiary should die in the lifetime of the testator, the devise or bequest in his favour lapses, or becomes altogether void. Of course this might in any case be provided against by express directions that in case of the death of the beneficiary, the benefit intended for him should go to his children; but such provisions are to some extent inconsistent with that simplicity which is essential in home-made wills.

* It should be understood that this series of articles deals mainly with English as apart from Scotch law.

Other points requiring special attention in some cases are that the subsequent marriage of the parents does not (in England) render bastards legitimate, or capable of taking under the description of ‘children’ of the testator; and that the marriage of a man with the sister of his deceased wife, or of a woman with the brother of her deceased husband, is absolutely void, and the children of such void marriage are illegitimate. In such cases, the difficulty may be overcome by the use of appropriate words and full and clear descriptions of the persons who are to be included in the will. In many home-made wills, the distinction between the effect of the two disposing words ‘devise’ and ‘bequeath’ appears to have been unknown. Now, there is a real distinction here, the former word applying to real estate (land), and the latter to personal estate (money, furniture, &c.); and in cases within our own knowledge, the use of a word which was not appropriate to one class of property, without any sufficient description of what was intended to pass by the will, has occasioned a partial intestacy, and to that extent has defeated the intentions of the testator. The word ‘give’ is always sufficient, and has the advantage of being safe. A common mistake is the omission of the appointment of executors; and an equal impropriety is the appointment of a tenant for life as sole executor. When everything which the testator possesses is given absolutely to one person, that person may well be appointed sole executor, in order that the power and the beneficial interest may be combined in one and the same person; but if an executor has only a life-interest in the income to arise from the property, some other should be appointed to act with him as joint executors.

The Wills Act, 1837, requires that certain formalities should be observed as to the attestation of wills and codicils. The latter instruments, however, scarcely come within the scope of this, as it is very rare to find a conjunction of circumstances in which it would be advisable for a testator to attempt to alter the effect of the will itself by adding a codicil thereto. Although the Act does not require the adoption of any special form of attestation, still it is very desirable that a well-designed form should be used, because it draws the attention of the parties to the statutory requisites, which cannot be neglected without danger of the will becoming mere waste paper. Such a form is the following, the insertion of which may be allowed to supersede the necessity for a long explanation: ‘Signed by the said A., B., C. as his last Will and Testament in the presence of us, present at the same time, who, at his request, in his presence, and in the presence of each other, have hereto subscribed our names as witnesses.’ Each witness should sign under this clause, and add his address and occupation. Formerly, if any witness had any interest in the will, the effect was to render the will void; but the inconvenience of this led to an alteration of the law, whereby in case of a beneficiary—or the wife or husband of a beneficiary—being one of the attesting witnesses, the will remains valid, except that the witness

cannot take any benefit thereunder; nor can the husband or wife of such witness.

Much misapprehension exists as to the effect of the marriage of a testator on a will previously executed by him. It is generally known that a will may be revoked by the making of a subsequent will; whether the revocation be express—which it ought always to be—or merely by necessary implication, the new will being inconsistent with the old one, and not merely a codicil which is intended to be supplementary thereto. But it is very difficult to persuade some people that *when a man gets married, he ought to make a new will*, the marriage operating as a revocation of the former will. There is no need to insist to any great extent upon the fairness of this rule of law, for it scarcely requires a moment's consideration to see that a will which would be quite proper for a bachelor, would be altogether unsuitable for the altered status of the same man when, by his marriage, he had taken upon him new duties and responsibilities. Few men would be so cruel as to wish their wills to remain unaltered when their position had so materially changed. Sometimes mischief is done by over-anxiety to provide for an intended wife; a man makes a will before his marriage, in order that his intended wife may be provided for in the event of his decease before marriage; and in ignorance of the rule of law as to revocation, he neglects to have his will re-copied, and then to re-sign it, and have the new will duly attested after the nuptial ceremony has been performed; in consequence of which neglect or omission, he ultimately dies intestate; and his wife only becomes entitled to the provision made for her by the law, although her husband intended her to have a much larger share of his estate. It is only requisite for this peculiarity to be known in order that the remedy, which is so easy, may be applied.

As to the revocation of a will by destruction, the legal distinctions often give rise to questions as difficult of solution as any which affect the original validity of wills. A testator who is of sound and disposing mind may cancel or revoke a will which he has previously made, without making another will to supersede it; and the usual mode of effecting this object is by the destruction of the will with the intention of revoking it. Here, however, all the necessary conditions must exist, or the will would not be revoked; and even if it were destroyed so utterly that its contents were undecipherable, and so destroyed by the testator himself, yet, if he did not intend to revoke the will, or was mentally incapable of disposing of his property, if the contents of the will could be proved in some other way, as from a draft or copy, probate would be granted of such draft or copy, although the expense of proving the will in that indirect manner would be considerably more than an ordinary grant of probate would cost. A very curious case was before the court some time since. A married man who had made his will in favour of his wife, in a moment of passion arising from his displeasure at something which she had done—nothing of any importance—tore up his will and threw the pieces at her before leaving the room where the quarrel had occurred. She was a wise woman, for she

gathered the fragments together and said no more on the subject until after her husband's decease, when probate was granted of the pieces, the court being of opinion that the deceased had not seriously intended to revoke his will, but had simply torn it when irritated to the verge of madness; and in this view the fact of his not having made a subsequent will was an important consideration.

The following brief observations as to the capacity of testators must bring us to the end of our present subject. A married woman who possesses any separate estate may dispose of it by will or otherwise as if she were single. An infant cannot make a valid will, nor can a person of unsound mind. But there are many cases in which a person may be capable of transacting all ordinary business, and yet be so much under the influence of some other person that his will may be set aside in consequence of the undue influence which has been brought to bear upon him. It is impracticable for us to enter at any length upon this part of the subject, as we have already trespassed by exceeding the space allotted to us. The simple rule is, that the will must be—as its name implies—an expression of the unbiased will and mind of the testator. Whenever the validity of the will of any deceased person is disputed on any ground, the due execution and attestation thereof have to be proved in court; but in ordinary cases the witnesses are not called upon when the will is proved, unless there is some irregularity or incompleteness in the attestation clause, or some erasure or interlineation in the will.

OCCASIONAL NOTES.

'ATLANTIC GREYHOUNDS.'

THE wonderful results achieved by the great Atlantic liners are only stimulating men's minds as to how the voyage may be still further accelerated. There are torpedo boats that can steam at the rate of twenty-two knots an hour, and enthusiasts now deem it possible to build passenger vessels which would double that speed. Professor Thurston proposes a steamer eight hundred feet in length, eighty feet beam, and twenty-five feet draught of water, as the best form yet known for quick sailing. The fast ships of to-day exert about one and a half horse-power per ton to reach a speed of twenty sea-miles per hour; but he anticipates some slight improvements which would reduce this figure. Though his leviathan may be expected to demand thirty-five thousand horse-power to make twenty knots an hour, he aspires to forty, and at this speed the horse-power required would probably amount to nearly two hundred and fifty thousand. The question is, whether the time saved would compensate for the expenditure of so much extra fuel. It appears that a vessel having a displacement of ten thousand nine hundred and sixty tons, and an indicated horse-power of ten thousand three hundred, consumes two hundred and five tons of coal per day; while a smaller vessel, having only nine thousand eight hundred and sixty tons displacement, and fourteen thousand three hundred and twenty-one indicated horse-power, consumes three hundred and fifteen tons

of coal per day, and yet the larger vessel has accomplished the passage in about eighteen hours longer than the smaller, and burned about six hundred tons of coal less. The present difficulty of naval architects is how to give greater speed with a low consumption of coal and the same carrying capacity. If passenger vessels relied solely on passengers, quicker voyages would be at once possible. However, there seems a growing tendency towards divorcing goods from passenger traffic, as railways have already done. Then light, yacht-like vessels of modern size would, for speed, safety, and economy, probably meet all the requirements of the passenger traffic. A high rate of speed, it may be presumed, will not be overlooked, whatever else. Some sanguine people believe that less than forty years will suffice to reduce the seven days of an Atlantic trip to three and a half, and Professor Thurston mentions about eighty hours. There are several arguments which point to the possibility of a great reduction. If we go back forty-one years, the *Great Britain* made the passage from Liverpool to New York in a little less than fifteen days, and though this was considered good, in 1874 the *Britannic* and *Germanic* placed Queenstown and New York within eight and a half days' sail of each other. The *Etruria* and *Umbria* have since made the voyage in six days six hours. Again, of the seven vessels engaged in the transatlantic trade which have made the passage in seven days or under, not one has been fitted with those latest aids to economy, triple expansion engines and forced draught. As a matter of fact, there is enormous waste; and an authority estimates that only one half of the total power exerted by the engines is effective in propelling the vessel. In addition to this, a very considerable portion of the heat energy of the fuel escapes through the funnel, instead of producing steam. Something might be done here towards securing greater economy; and by using high-pressure boilers and triple expansion engines, there is said to be a saving of as much as sixteen per cent. One thing seems to be pretty clear, that the fast steamers of the future will owe their speed to the engineer more than to the naval architect. The lines upon which modern racers are built are scarcely likely to be much improved. When the engineer gets the space at present devoted to cargo, for engines, boilers, and fuel, ewiffness will ensue, but at a greater cost, as a matter of course, as may be gathered from the fact that on the Atlantic voyage a gain of eighteen hours between two ships, in all respects equal, necessitates an expenditure of five hundred tons of coal extra. As, however, we have already predicted in these pages, oil may yet take the place of the bulky and unwieldy coal.

'ARMY PANICS.'

With reference to the article which appeared in a recent number of this *Journal* (No. 144), a Forfarshire parish minister sends us an incident copied from the diary of his father, who was in the 92d Highland Regiment, and which incident bears some likeness to that quoted from Napier's *Peninsular War* in the article above referred to. The 92d formed part of Lord Hill's division, which seems to have included also the 24th, the

50th, and 71st regiments, and a regiment of Guards. The incident is told as follows:

'Our division marched to a place within five leagues of Madrid, called Aranjuez, where the king of Spain has a grand palace on the banks of the Tagus. At this time, Lord Wellington was closely investing Burgos; but the French, bringing a large army into the country, forced him to raise the siege, and the whole of the English, Portuguese, and Spanish troops had to fall back upon the frontiers of Portugal. Our division, under Lord Hill, coming past Madrid in the course of our retreat, had to cross a large bridge at midnight. It was then that a very extraordinary thing occurred. In a moment and without any cause, for it whatever, all the troops were struck with a panic and driven into great confusion. Some were thrown on their backs, and others had their legs almost broken. Bonnets flew one way, and muskets another. This unaccountable panic extended to the rear of the whole division. A regiment that was lying asleep by the roadside was roused and thrown into confusion at the same instant. It so happened that next day the French came up to the bridge and a sharp contest took place. Our artillery was at one end of the bridge, and the French at the other. There was a very sharp fire on both sides with field-pieces and small-arms.'

THE TWO SEAS.

'When thou pass'st through the waters I will be with thee.'

Each night we are launched on a sea of sleep;

No doubts disturb us, no fears annoy.

Though we plough the waves of the darkened deep,

We know we are safe in the Master's keep,

And the morning brings us joy.

What dread, then, should daunt us, what doubt distress,

When on Death's dark sea we are launched alone?

In that deeper sleep, should we trust Him less?

Shall we limit to earth His power to bless?

Will the Father forsake his own?

He made us His children; He bears us to bed;

And whether our sleep be the first or the last,

What matters it where our souls are led,

If our trust in the God of the living and dead

Should only hold us fast?

J. B. S.

The Conductor of CHAMBERS'S JOURNAL begs to direct the attention of CONTRIBUTORS to the following notice:

1st. All communications should be addressed to the Editor, 339 High Street, Edinburgh.

2d. For its return in case of ineligibility, postage-stamps should accompany every manuscript.

3d. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.

4th. Offerings of Verse should invariably be accompanied by a stamped and directed envelope.

If the above rules are complied with, the Editor will do his best to insure the safe return of indigible papers.

Printed and Published by W. & R. CHAMBERS, 47 Paternoster Row, LONDON, and 339 High Street, EDINBURGH.

THE UNSEEN REGIONS OF A THEATRE.

THAT part of a theatre which is concealed from the view of the audience is always a subject of interest and speculation to the uninitiated, and most playgoers experience a desire to explore the mysterious region. When, therefore, some years ago, an opportunity presented itself to me of gratifying my curiosity in this respect, I did not fail to take advantage of it. Since then, I have been behind the scenes of various theatres, and my experience has convinced me that the public is not aware how small a portion of the house behind the curtain is exposed to the view of the audience, the regions both above and below the stage being more extensive than is usually imagined. Indeed, when, several years ago, the Opera House in Paris was burned, it was with surprise that the public learned from the newspapers that the edifice had no fewer than four separate underground floors.

At the present day, in most first-class theatres in London and New York the subterranean portion of the building consists of at least two or three distinct stories. The fact is, it is now quite impracticable to meet the requirements of a grand spectacular piece without ample space being provided for the scenery underneath the stage. Many, too, of the finest plays are so constructed that several changes of scene are required in every act; and each scene must be a masterpiece of the stage-carpenter's art, to satisfy the exacting demands of a modern audience. The old system, when an alteration of scene was necessary, was primitive enough. In some instances, there descended from the 'flies' a large curtain, on which was painted a landscape, or the interior or exterior of a building, as circumstances might require. In other cases, wooden frames, turned flats, with canvas tightly stretched upon them, were pushed upon the stage from either side, meeting at the centre, and frequently presenting an ugly seam at the place of junction. No little skill was

demanded in handling a huge frame many yards in height and width; for if it once lost its perpendicular, it became unmanageable, and fell—then requiring the exertions of several men to restore it to its proper position. The scenes also had a tendency to stick in the grooves in which they ran, and when this occurred, the disapprobation of the audience was incurred. It is said that a mishap of this kind having once taken place at one of the transpontine theatres, a spectator in the gallery called out: 'We don't look for grammar at this ere 'ouse, but we think yer might see that yer "flats" jine properly.'

All this is now altered. At the London theatres of the better class, when a change of scene is requisite, it is effected in a few seconds and in an admirable manner. An extensive landscape, or a lofty battlemented castle—so strongly constructed that it seems as if it were built of solid masonry—or a spacious apartment completely furnished, is, as if by magic, placed before the audience.

It has often struck us that playgoers scarcely adequately realise the extraordinary mechanical ingenuity displayed in the production of many of the pieces of late years presented to the public. Take, for instance, the fairy spectacle entitled *Le Roi Carotte*. In it there was a scene in which an old magician was dismembered in the presence of the audience. The situation was this: an aged sorcerer, in order to be rejuvenated, requests his friends to cut him into pieces and throw him bit by bit into a red-hot oven; after which process he expects to come out a young man. His wishes are complied with; he is put piecemeal into the furnace without his leaving the stage or ceasing to talk. Seated in an armchair, the old man asks that a large volume shall be brought in and laid on a table in front of him. The book, on being placed in the required position, becomes immediately vivified; living gnomes issue from the pictures on its pages and skip about the stage; after which they re-enter the book,

and it is closed and carried away. Then the legs and arms of the magician are cut off and thrown into the furnace; next he is decapitated, and his head is placed on the table, where it continues talking, giving instructions with regard to the trunk. After this the head is cast into the oven, which bursts open with a loud report, and a young and handsome man comes out of it.

The transformation is so ingeniously effected that the manner in which it is executed is incomprehensible to the ordinary spectator. This is the way in which the feat is accomplished: when the volume is placed on the table, the sorcerer, seated in the armchair, quietly withdraws his legs from sight, placing them on a trap beneath the level of the stage; at the same time he slips his arms under his loose gown, *papier-mâché* limbs being substituted in both instances for the real ones. This is done whilst the attention of the audience is diverted to the book and its animated pictures, which are little boys who come up from underneath the stage, through holes in the table and book, which is furnished with india-rubber springs, which close directly the gnomes have emerged from the volume. After the magician's legs and arms have been taken off and thrown into the fire, nothing is left but his trunk and his head. The latter is a mask which fits the actor's face, leaving nothing visible but his lips and eyes. One of the persons on the stage tugs at the magician's head until he pulls it off—that is to say, he removes the mask. As this is being done, the sorcerer has sunk down a trap, and he rises again through the table. The performer, with his head inserted in the mask, continues to talk, giving instructions with respect to the disposition of the trunk, which remains in the chair. Finally, the artificial head and the trunk, which are also of *papier-mâché*, are thrown into the furnace. The magician in the meanwhile has reascended by means of another trap farther back, slipping on a rich dress on the way; and when the oven bursts, the old man steps forth rejuvenated.

The reader must now see what skill and ingenuity the feat demands—what careful attention to every detail, what precautions against the slightest error, what rapidity in working of the traps, and what accuracy of movement on the part of the actor who plays the old magician. But, indeed, the skill and dexterity demanded of those to whom are intrusted the mechanical arrangements of some pieces, are far greater than are supposed by the public, who content themselves with admiring the results, without reflecting upon the care and labour they have involved.

In an opera called *Les Amours du Diable*, produced in Paris some years ago, there was a curious scene which puzzled all who saw it. A slight palanquin—constructed in such a manner that it was obvious that there was no possibility of its having a double bottom—was brought upon the stage supported on the shoulders of slaves. The actress, who occupied it, withdrew the curtains and gave some orders to her attendants. Then the curtains were closed for an instant, and again re-opened. But the occupant of the palanquin had disappeared.

What had become of her? The feat had been executed close to the front of the stage, and under a brilliant light; and the spectators could plainly see that it was certain that the lady had not gone down a trap. The mystery remained for some time unsolved. The explanation of the puzzle was simply this: the pillars of the palanquin appeared to be very slight, but instead of being wood, they were hollow metal tubes. Through these tubes, ropes run on pulleys at the top of the palanquin, descending in the inside, and fastened to the frame, on which was placed the silk cushion on which the actress reclined. To the other end of the ropes was attached a heavy weight which exactly balanced that of the lady. One of the slaves was impersonated by an expert machinist. So soon as the curtains were drawn, he pulled a cord which released the counterpoise, and the frame, together with its burden, rose to the dome of the palanquin. There the actress lay quite comfortably, a wire-gauze overhead enabling her to breathe freely. Pains had been taken in the constructing of the palanquin to make it appear frail, whilst in reality it was very strongly built, that the roof might bear the strain upon it of the weight it had to support. The bearers were men selected for their muscular strength, and they were drilled in the practice of taking up the palanquin—after the disappearance of its occupant—and carrying it off the stage at a sharp trot, as if it were empty.

Of recent years, great improvements have been made upon the old plan of representing the motion of the waves in a sea-scene. When, some years ago, a comedy called *Surf*, or *Summer Scenes at Long Branch*, was brought out at the Arch Street Theatre in Philadelphia, there was a scene in which the heavings of the ocean and the breaking of the waves upon the shore were imitated with excellent effect. Miss Logan, the authoress of the play, has described the ingenious mechanical appliances that were made use of on the occasion; she says: 'There was a large cylinder, reaching across the stage from wing to wing on either side, and garnished with curling stiffened canvas, running around the cylinder after the fashion of the threads of a screw. This was put in revolution by means of a crank at the end, which was turned by a man behind the wing. The curling canvas was painted to represent the foamy surf. Behind the first cylinder were two others of similar character which revolved in like manner. When the three were in motion together, with a peculiar arrangement of light and shade upon them, the effect was strikingly like the rolling in of the waves upon the beach. There were various other appliances employed to heighten the illusion, such as a large box of pebbles tilted to and fro behind the scenes in a manner to closely imitate the sound of the waves; a gauzy painted cloth worked up and down an inclined plane, and represented the thin wave that rushes up the sands and retires again; rows of broom-corn, painted green, simulated the seaweed. The characters of the play, who are supposed to go in bathing at Long Branch dressed in the usual costumes, sprang through openings made of india-rubber—painted like the rest—which closed behind them as water might, could, or should

do; and a little later, the actors, having passed under the stage by means of traps, reappeared at the back of the scene between the revolving cylinders, and jumped up and down, as if disporting themselves in the surf. The scene was very effective, and conducted largely to the success of the play.

Conflagrations on the stage are now so realistic as occasionally to alarm the spectators, who can scarcely believe that some portion of the scenery has not taken fire. But the precautions taken against danger are so thorough that there is no likelihood of an accident happening on these occasions. In a piece entitled *La Madonna des Roses*, which the writer once saw in Paris, there was the best representation on the stage of a conflagration he has ever witnessed. A fire was supposed to break out suddenly in an apartment in a ducal palace. Smoke and flame in a few moments poured forth in volumes from the windows and doors, and extending quickly to the walls, they fell in. They were constructed of two layers of wood, held together by thin cords, passing through holes. At the proper time, certain portions of the scenery were removed, leaving the others apparently burning fiercely—an effect produced by small gas jets arranged in rows around the edges of the frames. Behind the heavy set-piece at the back of the stage was a transparent curtain, on which flames were painted; and when the wall tumbled down, this scene being lit up, glowed with a lurid light in a very natural manner. At the same time, burning naphtha projected sheets of flame four or five yards in height, and large funnels overhead poured out torrents of black smoke mixed with sparks. It was indeed difficult for an audience to realise that the fire was not real, and that the whole of the scenery was not a heaving mass of flame.

In the description of the various mechanical contrivances resorted to in order to produce the scenic effects, the writer has been in some measure indebted to the theatrical reminiscences of Miss Olive Logan, an American actress.

BY ORDER OF THE LEAGUE.

CHAPTER XX.—CONCLUSION.

TURNING into Holborn, he ran on blindly, never noticing another figure following in his footsteps. It was getting very late now, and as he hurried into the Strand, St Clement's Dances struck midnight. Through the crowd there blindly, on to the water-side, the snaky figure close behind never off his track; on to the Embankment, and towards Waterloo Bridge. Then he stopped for one brief moment to regain his spent breath and think.

The following footsteps halted too; and then some instinct told him he was followed. Turning round again, full under the lamplight, he encountered Paulo Salvarini, determination in his face, murder in his eyes. In an agony of sudden fear, Le Gautier ran down the steps on to the Temple Pier, standing there close by the rushing water. A second later, with a clutch like iron, Salvarini was upon him.

'Ah!' he hissed, as they struggled to and fro, 'you thought to escape me, you murderer of

innocent women, the slayer of my wife! Now I have you. Back you go into the river, with a knife in your black heart!'

The doomed man never answered; breath was too precious for that. And so they struggled for a minute on the slimy pier, Salvarini's grip never relaxing, till, suddenly reaching down, he drew a knife. One dazzling flash, a muffled scream, and Le Gautier's lifeblood gushed out. Footsteps came down the stairs, a shrill shout from a woman's voice. Salvarini started. In one moment, Le Gautier had him in a dying clasp, and with a dull splash, they fell backwards into the rushing flood. Down, down, they went, the tenacious grip never relaxing, the water singing and hissing in their ears, filling their throats as they sucked it down, turning them dizzy, till they floated down the stream—dead!

Some boatmen out late, attracted by the scream, rowed to the spot; and far down below Blackfriars, they picked up the dead bodies, both locked together in the last clasp of death. They rowed back to the pier, and carried the two corpses to a place for the night, never heeding the woman who was following them.

Next morning, they saw a strange sight. Lying across the murdered man, her head upon his breast, a woman rested. They lifted her; but she was quite dead and cold, a smile upon her face now, wiping out all trace of care and suffering—a smile of happiness and deep content. Valerie had crept there unnoticed to her husband's side, and died of a broken heart.

For a few days people wondered and speculated over the strange tragedy, and then it was forgotten. A new singer, a noted poisoning case, something turned up, and distracted the frivolous public mind from the 'mysterious occurrence,' to use the jargon of the press.

Maxwell lost no time in getting to Grosvenor Square the following morning, where his greeting may be better imagined than described. He told Enid the whole story of his mission, omitting nothing that he thought might be of interest to her; and in his turn heard the story of Le Gautier's perfidy, and the narrow escape both had had from his schemes.

'I do not propose to stay any longer in London,' Sir Geoffrey said. 'After what we have all gone through, a little rest and quietness is absolutely necessary.—Enid, would you care to go down to Havesham?'

'Indeed, I should. Let us go at once. I am absolutely pining for a little fresh air again. The place must be looking lovely now.'

'All right, my dear,' the baronet replied gaily; sooth to say, not sorry to get back to a part of the world where, Sir Geoffrey Charteris was some one.

'Then we will go to-morrow, and Maxwell shall join us.'

'But Isodore? I have not seen her yet.'

'Oh, she can come down there some time, directly we are settled.'

Later on in the same day, Maxwell heard the strange tale of Le Gautier's death. He did not tell the news to Enid then, preferring to wait till a time when her nerves were more steady, and she had recovered from the shock of the past few days. So they went down to

Haversham, and for three happy months remained there, 'the world forgetting, by the world forgot'; and at the end of that time, when the first warm flush of autumn touched the sloping woods, there was a quiet wedding at the little church under the hill.

Gradually, as time passed on, Sir Geoffrey recovered his usual flow of spirit, and was never known to have another 'manifestation.' He burned all his books touching on the supernatural, and gradually came to view his conduct in a humorous light. In the course of time, he settled down as a model country gentleman, learned on the subject of short-horns and top-dressing, and displaying a rooted aversion to spiritualism. It is whispered in the household—only it must not be mentioned—that he is getting stout, a state of things which, all things considered, is not to be regarded with incredulity.

Nearly two years later, and sitting about 'the lawn before the grand old house, were all our friends—Salvarini, mournful as usual, little altered since we saw him last; Maxwell, jolly and hearty, looking with an air of ill-disguised pride at Enid, who was sitting in a basket-chair, with a little wisp of humanity in her arms, a new Personage—to use the royal phrase—but by no means an unimportant one. Lucrece was there, happy and gay; and Isidore, glorious Isidore, nutterably lovely as she walked to and fro, followed by Salvarini's dog-like eyes. The baronet made up the party, and alas! truth must out, looking—but we will be charitable, and say poorly.

'How long are you going to stay with us, Isidore?' Enid asked. She would always be Isidore to them.

'Really, I cannot say, Enid. How long will you have me?'

'As long as you like to stay,' Maxwell put in heartily.—'By the way, I suppose I am still a member of the League?'

'No, not now. Conditionally upon your promising never to reveal what you have seen and heard, you are free; Sir Geoffrey likewise.—Luigi here has resigned his membership.'

'I am so glad!' Enid cried. 'I must come and kiss you.—Fred, come and hold baby for a moment.'

'No, indeed'—with affected horror. 'I should drop him down, and break him, or carry him upside down, or some awful tragedy.'

'You are not fit to be the father of a beautiful boy; and everybody says he is the very image of you.'

'I was considered a good-looking man once,' said Maxwell with resignation. 'No matter. But if that small animal there is a bit like me, may I!—'

They all laughed at this, being light-hearted and in the mood to laugh at anything. Presently, they divided into little groups, Isidore and Luigi together. All her cold self-possession was gone now; she looked a very woman, as she stood there nervously plucking the leaves from the rose in her hand.

'Isidore—Genevieve'—

At this word she trembled, knowing scarcely what. 'Yes, Luigi.'

'Five years ago, I stood by your side in the

hour of your trouble, and you said some words to me. Do you remember what they were?'

'Yes, Luigi.' The words came like a fluttering sigh.

'I claim that promise now. We are both free, heaven be praised! free as air, and no ties to bind us. Come!' He held out his arms, and she came shyly, sprinkling, towards them.

'If you want me,' she said.

With one bound he was by her side, and drew her head down upon his breast. 'And you are happy now, Genevieve?'

'Yes, I am happy. How can I be otherwise, with a good man's honest love?—Carlo, my brother, would you could see me now!'

'It is what he always wished.—Let us go and tell the others.'

So, taking her shingly by the hand, they wandered out from the deepness of the wood, side by side, from darkness and despair, from the years of treachery and deceit, out into the light of a world filled with bright sunshine and peaceful, everlasting love.

DIAMOND-SMUGGLING.

In accordance with rules of concealment laid down by Edgar Allan Poe, the 'clever things' have of late years been done in the smuggling of precious stones into the United States of America, the philosophy which pervades Poe's story of the *Purloined Letter* having evidently been studied to some purpose by the professional diamond-smugglers, who are known to form a comparatively numerous body.

Poe's tale, the scene of which is laid in Paris, the characters introduced being of course French, contains what may be called a novel theory of 'hide-and-seek,' which, stated briefly, is, that the greater the importance of the article which has been stolen, the simpler should be its mode of concealment. On the assumption that an important state document, or criminatory letter involving serious consequences to some one, and the possession of which would enable another person to make use of its contents for his own benefit, has been purloined, the more conspicuous the place chosen to conceal it the better, till it can be made use of. Should the recovery of the stolen document be a matter of importance, which may be assumed, it will, of course, be carefully sought for, and those searching for it will no doubt pry with care into every secret hiding-place, with the hope of finding it; whilst—to put the case in a homely way—it is 'all the time staring them in the face,' those in search of it overlooking it because of their idea that, in consequence of its great importance, the utmost care will have been exercised in its concealment.

Much incidental and curiously instructive information is contained in Poe's *Purloined Letter* as to the modes of criminal search adopted in France, where magnifying-glasses of great power; and microscopes, play a part; where beds are dismantled and chairs are dis-jointed to see that what is wanted has not been concealed in some part of them; where libraries of books are turned over leaf by leaf, and picture-frames are tapped to see that they contain no foreign material. As Poe points out,

that is all in the way of routine, and is traditional among French criminal investigators in the matter of every-day crime. It requires a master-mind, however, to fathom the doings of a really well-educated thief who purloins an important document in order to hold it in terrorism over a political enemy or social foe.

So in the matter of diamond-smuggling. Artists—if we may profane the word—have come to the front, men far ahead of the original stereotyped smugglers, who were contented to carry on their business in old-fashioned ways; ever undogging their brains to find out modes of concealment so elaborate as to make sure they would be discovered. All the more extraordinary devices of concealment, as they were thought to be at the time, were one by one found out and battled with by the custom-house officers of the United States. Some of them were thought rather remarkable, as, for instance, those managed by means of artificial teeth—a set of these useful implements of mastication being fashioned in such a manner that every tooth possessed a cavity which contained one or more diamonds or other precious stones: the hole being deftly filled up with cement, discovery was thought impossible. By this ingenious mode of procedure, a large number of the rarer gems were at first smuggled into the States without paying duty (ten per cent. on diamonds), chiefly by means of female aid. Waxing bolder by long-continued immunity from any discovery of their fraud, the officers on duty began to wonder why the same ladies had so often occasion to cross the Atlantic; and one of their number surmising that it was 'for no good purpose,' determined to have a particular female carefully watched during the voyage. A stewardess with whom the officer had a friendly acquaintance was enlisted in the service; and this person did all she could to find out why the suspected ladies so frequently visited Europe, but to little purpose, as she thought, all she was able to discover being apparently not of much consequence. One day, however, whilst carefully examining the berth in which the traveller slept, she found a broken tooth, which was hollow and exceedingly fragile. As the stewardess used artificial teeth, she naturally enough felt interested in the matter, and spoke to the voyager about the circumstance. The lady at first looked embarrassed, but then said she had been cheated by the dentist. At the end of the voyage the stewardess reported the circumstance to the officer, who, after thinking it over, came to the conclusion that there was more in the affair of the hollow tooth than met the eye. New York, in fact, is celebrated for its dentistry; and on consulting one of the professors, the officer discovered that teeth of the sort had been made in quantity and from different moulds to the order of a very 'cute man, who said they were wanted to be sent to Europe. This statement afforded a sufficient clue; and accordingly, at the termination of the next voyage, two ladies, sisters, were respectfully but firmly requested to take out their artificial teeth. Remonstrance was unavailing; the teeth were made to disclose their hidden treasures; the result being that thirteen valuable brilliants were confiscated, much to the chagrin of the fair smugglers. That little episode put an end to that mode of smuggling diamonds.

There is a never-ending demand throughout the United States for these gems; and several of the earlier adventurers were known to have made money by means of the smuggling business. In reality, diamonds are a passion with many American ladies, who must have them, no matter what they may cost. These gem-loving dames, in their eagerness to 'trade' for jewels of all kinds, are not unfrequently cheated by persons who sell them 'bogus' diamonds, made of paste, at a comparatively cheap rate, under pretence of their being smuggled stones, and that, having escaped the payment of duty, they are a bargain at the sum demanded. Wealthy American ladies vie with each other at the various fashionable resorts of the United States in their displays of costly jewels and gems. It was stated a few months ago in an American paper that a rich man's wife wore upon her neck and breast every evening precious stones of the value of forty thousand pounds; other ladies displaying jewels to a lesser amount. Nor are American ladies free from the charge of smuggling; many of them, indeed, are adepts at the business, able to impart a secret or two to 'the professionals.' During a recent Saratoga season, one lady was heard to boast that she had brought over a suite of diamonds in the heels of several pairs of slippers which she had made on purpose to contain them. These dainty articles were ostentatiously displayed, and taken notice of by the searchers; but the heels were not suspected to be hollow or to contain diamonds. Hollow-heeled boots were at one time greatly in vogue as a part of the smuggling machinery. That mode of carrying on the illicit traffic was ultimately discovered by an under-steward of an American liner, who, for 'a consideration,' communicated the secret to the custom-house authorities. Then followed a series of contrivances in the shape of double-bottomed trunks, valises with secret pockets, desks with hidden drawers, and guns and pistols which were so contrived as to contain a few of the much-coveted gems. All these contrivances were in turn discovered: they were just the kind of concealments which the officers had their thoughts fixed upon. For a time, we believe, the professional diamond-carriers were discomfited; but their discomfiture was not for long; the business was too profitable to be easily relinquished, however great the risks might be.

Just as the customs' authorities were under the impression that they had suppressed the illicit traffic, a new era in gem-smuggling was inaugurated, and more diamonds reached the United States 'duty free' than before. Smuggling it may be said, developed into a fine art; at all events, the incidence of the trade for a brief period became so simple as to seem like child's play; indeed, children were made to play an important part in the business. A story which lately became public shows how well the modern diamond-smugglers had laid to heart Poe's precepts. 'Please to hold my baby whilst my husband helps me to open my trunks; he will be quite good if you will shake his rattle,' said a lady passenger to the officer who was waiting to look over her travelling gear. And that officer good-humouredly did as he was requested, shaking the rattle, to the great delight of the little one. The rattle in question, which,

fastened to a ribbon, was tied to the child's waist, was filled with gems of great value, a mode of smuggling that at the time was too too simple for detection.

A clever female attired in the costume of a Sister of Mercy was passed over by the officers because she had no luggage worth examining. She possessed, however, a fine string of beads, which, with downcast eyes, she kept telling. Safe on land, she was affectionately welcomed by two persons dressed in costumes similar to her own. Need it be told that she was a smuggler, and that her beads were so constructed that each held a diamond weighing seven or eight carats. Another ingenious person hit upon the plan of placing a few precious stones in a toy kaleidoscope which had been given to a child, who carried it ashore in safety. A number of homing pigeons kept in cages, and purchased at a village in Belgium, and brought to the United States by way of Paris and Havre, also played a profitable part, each of the pigeons being freighted with a cargo of exquisite gems, concealed in quills, and carefully fastened to the message-bearing dove. An extensive system of diamond-smuggling was at one time carried on from Canadian ground by the aid of homing pigeons. The discovery of this illicit trade was made accidentally by a farmer, who happened to shoot one of the birds, and on examining it found that there was fastened to its leg a quill containing a number of diamonds! A clue being obtained, the local habitation of the pigeon proprietors was discovered and their mode of business put an end to. The scheme, stated simply, was to fly every week or ten days a flock of a dozen or fifteen pigeons, each carrying about half-a-dozen gems. As the duty on diamonds amounts to ten per cent., the trouble taken to smuggle these gems into the United States does not seem so very remarkable. The value of the precious stones honestly imported into the States is between eight and nine million dollars per annum, and it has been calculated that gems to half that sum escape payment of the duty.

Many tales have been circulated with regard to diamonds, some of them of a rather curious kind. We have read of faithful messengers who, rather than yield up the stone they carried, swallowed it. The owner of a slave who had done so, and who had been killed by robbers, was so convinced of his servant's fidelity, that he gave directions for the opening of the body, and found that the honest fellow had swallowed the precious gem. Dishonest servants employed at the diamond mines frequently display wonderful ingenuity in concealing stones which they have purloined while at their work. About a year ago, a rough diamond weighing four hundred and fifty-seven carats was stolen by a person in the employment of the Central Diamond Mining Company at Kimberley (South Africa), who sold it for the sum of three thousand pounds to four persons who dealt in stolen stones. It was then sold at Cape Town to a firm of illicit dealers in diamonds for nineteen thousand pounds; and was ultimately purchased for forty-five thousand pounds by a syndicate of London brokers in precious gems. The means by which this magnificent brilliant was smuggled from the mines and ultimately got to England was never made

known. It is notorious enough, however, that a large trade in fraudulently obtained stones is carried on at the South African gold-fields; and stories are told of buyers around the diamond mines who have made large fortunes by purchasing stones at nominal prices from labourers who possessed the cunning and the courage to successfully brave the authorities and bring to the resellers their stolen goods.

It has been calculated by persons engaged in the business that twelve per cent. of the fall in the price of rough diamonds, which has taken place within the last few years, should be set down to the sale of stolen gems, which, to the value of more than half a million sterling, annually find their way to the markets. These stones are the direct fruits of theft, those selling them having made no contribution whatever to the cost of obtaining them. When first the work of diamond-seeking at Kimberley began, there were no thefts of any importance, because each man was then working for his own hand, or as one of a limited but friendly partnership. It was not till the work of diamond-mining required the aid of hired labour that the work of systematic robbery commenced, and 'I. D. B.' (illicit diamond buying) became an institution of the Diamond Fields. Many of the persons employed, soon fell into habits of peculation, not being able to withstand the temptation presented by the appearance of a little bit of stone that might be worth, perhaps, a thousand pounds, if they could succeed in carrying it away without being detected. In every branch of the process of gem-finding, valuable diamonds, it has to be explained, are always at the mercy of the men employed, some of whom are never slow to take advantage of any chance that may present itself of securing a stone. Such thefts during the last few years have proved a source of serious annoyance and trouble in connection with the industry. The 'I. D. B.' trade, as it is locally termed, has tended to sap the morality of the place, and given rise to the many evils which result from resetting. There is an old adage which says that 'if there were no resetters, there would be no thieves.'

Great precautions are taken by the various diamond-digging Companies at Kimberley to prevent the theft of stones; whilst the crime of reset is always punished with much severity. A license to deal in rough diamonds costs a sum of fifty pounds per annum; and dealers, in addition to procuring this authority to trade, are required to find security to a large amount. Dealers are bound by the terms of their license to make exact entries in their books of every parcel of stones they purchase, and also how they dispose of them. Large diamonds must be described in detail and minutely. Should the detective department suspect any dealer of illicit traffic, that dealer may at any moment be visited, and have his books and stock overhauled and compared; and should he possess a few stones which he is unable to account for, he is liable to have his whole stock seized. Upon a late occasion, a friend of the writer's, while on a visit to the Kimberley Diamond Fields, was informed that two well-known diamond dealers had just been visited by the detectives; and one of these persons having about eight hundred carats, and the other about seventy carats, not accounted for in their books, the police seized

their stocks—upwards of ten thousand carats in all; and within one month from the date of the seizure, both dealers were tried, convicted, and sentenced; and if still alive, they are now working out their time on the breakwater at Capo Town. One of these men was reputed to be worth over a hundred and fifty thousand pounds. At the present time, there is quite a colony of convicted 'illicitists,' as they are sometimes designated, working out their sentences on the harbour-works at Cape Town, a goodly proportion of the gang being worth large sums of money.

Although there is a considerable and clever detective staff on the Diamond Fields, there are those at Kimberley who can outwit the police, at anyrate for a time, and so it happens that such a number of stones is annually stolen as to prove a factor in disturbing the market price. The chances of detection are no doubt great; but the hope of securing a few hundred pounds by a little speculation is so tempting, that there are always hundreds of men at 'the game.' Some of the thieves—that is, the men who steal the stones they are paid for unearthing—display great ingenuity in carrying away the gems. The business of diamond-digging is naturally of a rough-and-ready kind, and presents opportunities for fraud which are not available in other industries. When diamond-stealing first became a business, those interested, suspecting no evil, were easily cheated. Stones were then carried away concealed about the person of the labourers. But, as the thefts increased, greater precautions were taken to insure the detection of the thieves. Some of the 'dodges' which have been resorted to in order to carry diamonds from the diggings have been not a little remarkable; we have only room, however, for a sample or two. Upon one occasion, it is related that an ingenious labourer wrapped the stones in a small piece of soft bread, the morsel being greedily snapped by a dog. The dog was carefully looked after till the mine was left behind, when it was ruthlessly killed, to obtain the hidden diamonds which were contained in its stomach. Domestic fowls have been trained to swallow the smaller stones, which have afterwards been cut out of their crops. A parcel of stolen gems has been known to have been got out of a well-watched digging by having been ingeniously fastened to the hair of a horse's tail!

Any individual suspected of being an 'I. D. B.' may expect, on leaving the Fields, to be overtaken on his road to the coast by detectives, who will search him in order to find if he be in possession of any stones. Many devices have been resorted to for the concealment of the diamonds. A Dutch Boer who had been for some time under suspicion, on leaving the Fields with his wagon was followed by some detectives who had determined to search him. Just before he was overtaken by the officers, he was seen to detach one of the bullocks from his team and deliberately shoot it. By the time the police came up the Boer was busy removing the hide. A thorough search was made by the detectives; but no gems were found. The phlegmatic Dutchman had placed the diamonds in the barrel of his gun, and had fired them into the body of his bullock, from which of course he had to extract them; and he did so as soon as the police turned their backs upon him.

The various modes of diamond-smuggling revealed in the foregoing narrative present no peculiar features of endurance or romance; but cases have occurred in which pain and suffering have played a part in the business of diamond-hiding. There is, for instance, the story of the magnificent gem which in its rough state formed the eye of an idol in a temple near Trichinopoly, and which was stolen by a Frenchman, who escaped with his prize to Persia, and who, fearful of being discovered, was glad to dispose of his ill-gotten gear for a sum of about two thousand pounds sterling. The man who bought the stone, a Jewish merchant, sold it to one Shafraz, an astute Armenian, for twelve thousand pounds sterling. Shafraz had conceived the idea that by carrying the stone to Russia, he would obtain from the Empress Catharine the Great a princely sum for it. How to travel in safety with the stone, the theft of which had of course been discovered and proclaimed, became a grave consideration. It was too large to swallow, and no mode of concealment presented itself to Shafraz that seemed secure from discovery. The way in which he solved the problem was remarkable. He made a deep incision in the fleshy part of his left leg, in which he inserted the stone, closing the wound carefully by sewing it up with silver thread. When the wound healed, the Armenian merchant set out on his travels quite boldly, and although more than once apprehended, rigorously searched, and even tortured a little, he was obdurate, and firmly denied having the stone in his possession. Having at length reached his destination, he asked from the Empress the sum of forty thousand pounds for the gem, an amount of money which Catharine was unable to raise at the moment. We next find the Armenian at Amsterdam with the intention of having his diamond cut. Here the stone was seen by Count Orloff, who determined to purchase it for presentation to his royal mistress, the Empress Catharine. The sum ultimately paid for the gem was about seventy thousand sterling in cash, together with an annuity of five hundred pounds, and a patent of nobility. Shafraz flourished exceedingly, and died a millionaire. Such, in brief, is the story of the Orloff Diamond.

'DOUBLEWORKS.'

A STORY OF ATHLONE.

Who has not heard of the old historic town on the Shannon called Athlone, believed by its inhabitants to be the exact centre of Ireland; celebrated at one time—for it has been now some years removed—for the old bridge built in the reign of Queen Bess, whose arms and monogram, E. R., were engraved on a stone built into a kind of monument on the parapet. Celebrated also for its old church bell, bearing in relief the inscription—THIS: FOR: ST. MARY'S: CHURCH: IN: ATHLONE: 1683—the bell being the identical bell which, at six o'clock in the afternoon of the 30th of June 1691, clanged the signal for the attack on the forces of King James, commanded by the French general, St Ruth, and holding the castle, &c., by the troops of the Prince of Orange

under Ginkell. The old house occupied by him as headquarters during the siege is still in existence, having the date of its erection, 1626, carved on the doorway. We might go on detailing many other things for which the old town is celebrated, but *cui bono*? Enough that it is celebrated in song as the residence of 'The Widow Malone, Ochone!'

Often as we have been reminded of the existence of Athlone by hearing the above-mentioned humorous ditty trolled forth at mess by one of Ours, who, being a genuine son of the soil, was fully qualified to do it ample justice, it had never been our good fortune to cast eyes upon it until some forty years ago, when, one fine afternoon, we found ourselves, with some thousand or so other candidates for martial glory, marching gaily through the by no means sweet-smelling town, over the beautiful new bridge which spans the river, and under the walls of the ancient castle, to the merry strains of the *Lass o' Gowrie*. These forty years are a long time to look back upon; many a long march under foreign suns have we made with the old regiment, and in many a stirring scene and hard-fought field have we accompanied it since then; but somehow our memory recalls few things more vividly than the appearance of that long column of dusty, travel-stained men, who were finishing their hot day's march that summer afternoon, tramping along briskly and cheerily to the old familiar air of the regimental quick step.

We quickly settled down in our new quarters, and before long, had formed many pleasant acquaintances, all only too delighted to show us every civility in their power; and jolly nights at mess followed fishing and boating parties during the summer, while, as the days began to shorten, there was good hunting and shooting; and dinner-parties and dances were by no means unfrequent.

In most garrison towns in which we have been quartered in Ireland, there were generally one or two peculiar hangers-on loafing about the barracks, queer nondescript hipeds, ever ready to run messages all over the country, or carry a fishing-basket or a game-bag, who eked out a precarious existence by tips from the officers and others who employed them, and picking up odd meals at the different barrack-rooms of the men. Athlone was not singular in this respect; and you constantly met, shambling across the barrack square, at a kind of half-trot, or lurking in rear of the officers' quarters, an odd, half-witted, but quite harmless creature, who went by the curious appellation of 'Donhleworks.' Who gave him that name, or whence it was derived, we are unable to say; we only know that he answered to it, and we had it from the regiment in whose place we had come. There was a kind of sporting air about this poor creature; he always wore an old hunting-cap and a shooting-suit, evidently the gift of some former patron of far hurlier proportions than the poor attenuated frame which

they now enveloped; and an ancient pair of Wellington boots, much down at heel, into which the ends of the trousers were shoved, completed the costume, which, however, was varied on hunting-days, when the hounds met in the square or neighbourhood of the barracks, when, in honour of the occasion, an aged and lurch stained, once scarlet hunting-coat took the place of the shooting-jacket.

Like the other hangers-on of the Athlone barracks, poor Donhleworks subsisted, as we have said, upon the benevolence of his military patrons and friends; but, unlike the others, he was possessed of an accomplishment, not an elegant one, perhaps, or suitable for very refined society, but nevertheless one that brought him by its performance many an odd sixpence or shilling—he could hunt the hader! or was supposed to give a truthful representation of the 'drawing' of the above-named quadruped by a canine foe. This performance was vocal, and commenced by a series of whines, growls, and impatient harkings, mingled with grunts and low savage yelps, which we believe were meant for cries of rage and defiance from the badger; these, after lasting with variations for some time, gradually increased in intensity, at length culminating in an unearthly din, perfectly indescribable, but which was stated by the 'fancy' and capable authorities to be quite true to nature. For ourselves, not having had experience in such matters, we are unable to offer a personal opinion, and can only observe that the din was marvellous as the production of a single pair of human lungs, and once heard was not likely to be ever forgotten.

His performance was not confined to any particular part of the barracks; it might be heard at any hour of the day in the artillery square, the cavalry square, the infantry square, or amongst the barracks occupied by the scientific arm of the service, the Royal Engineers; but it took place most frequently at the officer's guardroom; for in those days there used to be an officer's guardroom and an officer in it at the main barrack gate, which led directly from the infantry square into the market-place of the town. This guardroom was in the centre of a small block of buildings to the left of the gate as you went out, having on its right the regimental orderly-room, where the colonel administered justice every morning, and where the orderly-room clerks smoked strong tobacco, and filled in forms and sketched caricatures of regimental and other authorities every day. The men's guardroom adjoined that occupied by the officer, from which it, as well as the orderly-room, was separated by a partition wall, the end wall of the men's guardroom being next the street. In front of these rooms was a small veranda, and beyond this the guardroom sentry paced his 'lonely round.' We are thus particular in describing the locality, as it pleases us to recall it after so many years, because it will give our readers a better idea of what is to follow.

The guardroom—we mean the officer's—was in those days a kind of club or place of call for all officers going out or coming in to barracks. It was considered incumbent on every passer-by to drop in on the officer of the guard and help him to while away the tedium of his confinement

by retailing any news there might be going; while he on his part provided alleviation for any thirst accruing from dry narration. By night, the guardroom was generally pretty full until a late hour. A recent order of the Duke of Wellington, then commander-in-chief, and which procured for him the cognomen of 'the Tobacco-stopper,' prohibited the use of tobacco in the precincts of the mess; and though this order was afterwards so far modified as to permit smoking in the anteroom, it was confined to cigars; so those who preferred the luxury of a pipe had either to indulge the propensity in their own rooms or seek the shelter of the guardroom. Needless to say, the latter alternative was the one most generally followed, and the hospitality of the subaltern on guard was accepted as freely as it was offered. Altogether, the main-guard was not a disagreeable place to spend twenty-four hours, especially if it rained, which it can do in those parts, and we ourselves preferred it to the duties of regimental orderly-officer.

One day in the mid-winter of 1846, it came to my turn to mount this guard. The weather had been unusually severe—it had been snowing for a day or two, and the ground was covered to the depth of several inches, while a smart frost had served to make the snow hard as a brick; so that, as I marched my guard across the square to where the old guard was drawn up, waiting our arrival, the men's tread made no more track than if we had been marching on the surface of the square itself. The preliminaries of relieving guard having been got over as quickly as possible, we paid the parting compliment to the old guard of presenting arms, as it moved off in slow time; and then dismissing our own, we visited the sentries, to ascertain if they had the orders of their respective posts correctly, and then gladly drove into our own den, and doffing our cloak, proceeded to make ourselves as comfortable in front of a huge peat-fire as it was possible to be, braced up in a high stiff stock and tightly fitting coat and epauletts, as was then the regulation.

The day passed like most others on guard; but, owing to the weather, the passers-by were fewer; and our after-mess visitors didn't stay so late as usual; by eleven or half-past, all had taken their departure for their respective quarters; and about midnight we proceeded to go round the sentries. There was a bright moon, with a clear star-studded sky. It was not unpleasant walking over the hard frozen snow, and we were not long reaching the farthest-off and last of the sentries, who was posted at the hospital gate. Besides the usual orders, he had special directions to look after the dead-house, a small building situated close inside the hospital gate, to which the bodies of deceased men were conveyed until interment, and to allow no one to enter it unless passed in by the hospital-sergeant. The sentry, when giving up his orders, added that a man had died in the hospital late that evening, and that his corpse was now lying on the table in the dead-house. Accompanied by the corporal of the escort, we walked over to the window, and by the bright moonlight could see something extended on the table, as the man had said, covered with a sheet. After this, we came back across the square to the guardroom, and lighting

a pipe, were soon deeply interested in a book that we were reading. Gradually we began to nod, and the book to slip from our hand, and the grand-rouds having already visited the guard, and there being but little danger of having to turn it out again before the morning's reveille, we were about to go to sleep in earnest on the guardroom sofa, when we were startled from our semi-somnolent condition by hearing the loud challenge, 'Who goes there?' from the sentry who had been pacing up and down in front of the veranda. We could hear the rattle of his arms as he threw his firelock to the 'port,' and the rapid tread of some one running towards the guardroom and crunching the frozen snow. Presently the challenge was repeated in a quick peremptory tone, but, as in the former case, without obtaining any response; and then there came a kind of half-articulate gurgling cry, followed by the sound of a heavy fall, and the crash of arms and accoutrements, and the shout of, 'Sergeant of the Guard!'

Fearing that something bad had happened, we jumped up and dashed out of the guardroom, and saw lying on the snow, close to the sentry, who was standing at the 'charge,' the figure of a soldier clad in his greatcoat and fully accoutred, and a little way from him his firelock with fixed bayonet lying on the snow, as it had escaped from his grasp in falling. The sergeant and all the men of the guard had rushed out at the same time as we had, and were now engaged lifting the prostrate figure, who at the moment we feared had been run through by the sentry for not replying to the challenge, and trying to run past him. Such, however, happily was not the case; the sentry hadn't touched him, and said that the man had come rushing towards him from the far angle of the square, and instead of answering the challenge, had continued to approach, making the queer gurgling sound which we had heard, and falling as if shot when he came to where he now lay.

The sergeant of the guard now reported to me that the man was alive, though quite insensible and making a moaning noise, as if in a fit. He further stated that he was the sentry who had been posted at the gate of the hospital. We at once sent a man of the guard for one of the assistant-surgeons of the regiment whose quarters were close at hand, and had the insensible man carried into the guardroom and laid on the guard-bed, his stiff leather stock removed, coat, &c. unbuttoned, and water sprinkled on his face; but all, seemingly, to no purpose: he remained unconscious, and kept up the moaning noise, while now and then struggling hard with those about him. At last the doctor arrived; and having administered some restoratives, after a while the poor fellow became sensible, and sufficiently calm to inform us why he had committed the serious offence of deserting his post. He stated that he had continued to walk about on his beat at the hospital gate for some time after we had visited him, and that all was quiet, when suddenly sounds as if of chairs being upset and knocked about appeared to come from the dead-house; that he had gone up to the window, as we had a short time before, and looked in, and that he saw the corpse off the table, and standing up close inside the window,

and that it, as he said, 'jeered' at him; that this fearful sight had so unmanned him, that without more ado he had taken to his heels, and had no recollection of anything else that happened until he returned to consciousness on the guard-bed. He was evidently suffering from a terrible shock to his nervous system; and it was only with the greatest difficulty that, mingled with heavy sobs and shuddering, we could manage to get the poor fellow to speak: he was driven nearly demented by the ghastly sight which he was persuaded that he had witnessed.

As soon as he could be left with safety to the care of the guard, who were directed not to pester him with questions, the surgeon and I with a corporal and file of men set off for the hospital; and as we crossed the square, strange noises began to reach us, the growling, snarling, and other sounds of canine conflict mingling with the unmistakable howls with which Doubleworks interlarded his performance.

'Hillo!' we said to the doctor; 'do you hear that? What an hour for Doubleworks to be hunting the badger; we thought he was never allowed in barracks after tattoo.'

As we neared the hospital, the badger hunt, which had ceased for a few moments, broke out afresh, this time mingled with shouts of wild unearthly laughter, and proceeding unmistakably from the dead-house, in which the corpse of the dead soldier had been deposited. We roused up the hospital sergeant, who, good quiet man, snored serenely through it all, and got from him the key and a lantern, and opening the door, found that with the dead man the wretched Doubleworks had been locked up. How he got there unnoticed, no one could tell; he had not been observed by any one about the place; and the only conclusion that we could arrive at was, that he had slipped in when the body was being placed on the table, and had ensconced himself behind the door until it was pulled to and locked upon him.

However true this theory might have been, there was no means of verifying now, for, from whatever cause arising, it was but too evident that poor Doubleworks had become quite insane. He had removed the sheet from the body of the dead man, which lay there in its solemn stiffness before us, in strange contrast to the mad pranks of the lunatic, who, having, no doubt, wrapped himself in the sheet, had presented himself so disguised to the sentry, when he looked in at the window, thereby almost driving him as mad as he was himself.

Why he didn't favour us with a similar exhibition when we went to look in at the window, we can't imagine; perhaps he may have objected to the presence of more than one spectator, for he must have heard the steps of the corporal and file of men who were with us when going our rounds. At anyrate, he made no objection to leaving the dead-house now, though he seemed in no way in dread of the other occupant of it. He was next day made over to the civil authorities, and was afterwards transferred, we heard, to the district lunatic asylum; and what was his subsequent fate, we do not know. The sentry he had so horribly frightened, after several weeks in hospital, returned to his duty; but we don't think he ever quite got over the shock,

and he was discharged from the service within a twelvemonth after. Perhaps he may be still alive, and if so, we will bet a trifle he has not forgotten Donhleworks.

RUSSIAN PETROLEUM.

MR CHARLES MARVIN, who has already done much to familiarise English readers with the Russian petroleum industry and the extraordinarily prolific nature of the oil-wells at Baku, on the Caspian, has again returned to the subject in a pamphlet entitled *The Coming Deluge of Russian Petroleum* (Anderson & Co., Cockspur Street, London). As these wells, when transport facilities are more perfect, may seriously affect the home and American oil-trade, the facts brought out in Mr Marvin's pamphlet are worthy of attention.

We learn that of the five hundred petroleum wells at Baku, the majority are situated on the Balakhani Plateau, eight or nine miles to the north of the town. The latest 'spouter' of Tagieff's is, however, in a different locality, being situated on a promontory three miles to the south of Baku. Here Gospodin Tagieff began boring about three years ago. At first, the oil was slow to come, and at its best had never yielded more than sixteen thousand gallons a day. On the 27th September last, having touched oil at seven hundred and fourteen feet, the well began to spout oil with extraordinary force. 'From the town, the fountain had the appearance of a colossal pillar of smoke, from the crest of which clouds of oil-sand detached themselves and floated away a great distance without touching the ground. Owing to the prevalence of southerly winds, the oil was blown in the direction of Bailoff Point, covering hill and dale with sand and petroleum, and drenching the houses of Bailoff, a mile and a half away. Nothing could be done to stop the outflow.' It seems that the whole district was covered with oil, the outflow being at the rate of thousands of tuns a day, which filled up cavities, formed a lake, and on the fifth day began to escape into the sea. The square in front of the town-hall of Baku was drenched with petroleum. On the eighth day, the outflow reached the highest ever known—a rate of eleven thousand tuns, or two and three-quarter million gallons a day. 'Thus,' says Mr Marvin, 'from a single orifice ten inches wide there spouted daily more oil than was being produced throughout the whole world, including therein the twenty-five thousand wells of America, the thousands of wells in Galicia, Roumania, Burma, and other countries, and the shale-oil distilleries of Scotland and New South Wales.' By the fifteenth day, those in charge had got the outflow so far under control as to restrict it to one quarter million gallons a day. It was certainly a misfortune that of the ten million gallons of oil ejected from Tagieff's well, most of it was at first lost for want of storage accommodation.

The yield of oil at Baku is thus much ahead of the greatest product of the American wells. Nobel Brothers' No. 18 Well has yielded, from a depth of seventeen hundred and twenty-one feet, nearly thirty million gallons of oil; and

their No. 9 Well, from a depth of six hundred and forty-two feet, forty million gallons. Some of these wells are kept closed while oil is being sold at so cheap a rate. Against the assertion that the product of these wells may dry up and will not last very long, Mr Marvin says that there is ample historical evidence that petroleum has been flowing from the Apscheron peninsula for two thousand five hundred years, and that there seems more likelihood of the American wells drying up than those of Baku. Besides, the petroleum region of the Black Sea has scarcely been touched, and there the oil seems as plentiful as in America.

Owing to this prodigious outflow without a ready market, oil was selling there, in the beginning of October last, at *one penny per sixteen gallons*. The best refined petroleum or lamp-oil is sold at three-farthings a gallon. The production of crude petroleum last year exceeded four hundred and twenty million gallons; there are now one hundred and twenty firms with oil-refineries at Baku, which last year turned out one hundred and twenty million gallons of refined petroleum. The production in 1878 was only one and a quarter million gallons. The bulk-system of transport, as distinguished from carrying in barrels, first adopted in 1879, has had a tendency to revolutionise the trade, and now there are one hundred oil steamers on the Caspian. Some of these steamers have a capacity of carrying eight hundred tons of oil each trip.

After extracting thirty per cent. of lamp-oil, and allowing ten per cent. for waste and drags, the remaining sixty per cent. of every hundred gallons, is used for lubricating and other purposes. Large quantities are imported by certain firms in London, for the manufacture of lubricating oils. Although thus exported, the supply of this waste or residue is so great that it has become the principal fuel in South-east Russia. Steamers purchase it at Baku at fourpence a tun, to be used as fuel. When sent by rail to Batoum, the price rises as high as one pound per tun, which is still cheaper than English coal. More than two hundred and fifty tank and many passenger steamers and locomotives now use this waste oil as fuel in place of coal. A tun of liquid fuel is said to do the work of two or three tons of coal: the chief advantage of its use consists in the fact that it can be turned off and on like gas; it is clean, and takes up very little bunker-space, a matter of great importance to steamers travelling to long distances. The Black Sea Steam Navigation Company, owning seventy-six steamers, intend to commence using this oil-refuse.

The chief outlets for the transport of Baku oil at present are by the Volga and the Transcaucasian Railway. A concession has been granted by the Russian government for laying down a petroleum pipe six hundred miles long for the carrying of the oil from Baku to a point on the Black Sea. The pipe must be large enough to carry one hundred and sixty millions of gallons of oil a year; and it is expected that three years will elapse before it is in working order. Meantime, the North Caucasus Railway will be completed in 1887, and it is expected that it will convey at least one hundred million gallons of oil to the port of Novorossisk, on the Black Sea.

Thence it can be shipped in tank steamers to Europe.

We learn that a huge iron reservoir is being built at a remote spot in the outer harbour of Amsterdam for the storage of petroleum. It will be nearly thirty-three feet in diameter, and of the same depth, and is calculated to hold nearly one million seven hundred and forty thousand gallons. The petroleum will be brought direct from Russia in these tank steamers, and will be pumped out at Amsterdam into the tanks, thus saving the expense of filling and emptying casks, besides diminishing the risks of accidents.

Mr Marvin is of opinion that the world is consuming more oil yearly, and he calculates the daily consumption at two million gallons. Along with the cheapening of the oil have also come great improvements in the make of lamps, such as the Defries Safety-lamp, in which the receptacle for the oil is formed of brass. Mr Marvin makes the sensible suggestion, that as Russia is flooding the surrounding countries with oil, our manufacturers might supply the south-east of Europe with lamps, and thousands of cooking and warming stoves. It appears that there is not a country in Europe to which Baku oil is not now shipped, and the figures quoted show that American petroleum is being driven from the Black Sea and the Mediterranean. Mr Marvin is of opinion that the shale-oil industry of Scotland already shows signs of yielding to the competition of America, 'and unless special circumstances should arise, must eventually be crushed by the rivalry of Russian petroleum, when imported in bulk.' And apparently he has written his pamphlet in order to rouse British ship-owners, manufacturers, and capitalists to secure a share in the expansion and development of the Baku oil-trade.

[We have on more than one occasion advocated the use of oil in calming broken billows at sea, and thus saving a ship or boat which otherwise might succumb to the fury of the storm. Might it not, therefore, be worth while to make further experiments in the abandonment of costly coal, and fit up steamers with this comparatively cheap material, which, while driving the ship, might in a heavy seaway save her, if the oil be allowed to ooze from bags made fast to windward? The use of oil at sea during rough weather cannot be overestimated.—Ed.]

TOBACCO-CULTURE IN SCOTLAND.

It is quite right for agriculturists to do what is possible in the direction of introducing new kinds of crop that may possibly turn out remunerative; and in this view, some interest is attached to recent experiments in the culture of tobacco. If the North Americans can compete with British farmers in the production of good beef and mutton, Britain may possibly maintain the equilibrium by cultivating the weed of which the New World has long had a monopoly. Potatoes were introduced into this country from America, and have proved to be a rich benefit. It is just possible that tobacco also may turn out to be a not less lucrative gift to the producer. More than a hundred years have elapsed since a trial was made in Scotland, principally, but not exclusively, in the south-eastern counties. It failed

at that time, through the combined influences of a bad season, the interference of the government—believed to be at the instance of Glasgow merchants—and ultimately of a rapid fall in the price of imported tobacco, a combination of circumstances not likely to occur again.

Of the trial made towards the close of last century, a detailed account has been left on record by the Rev. Dr Somerville of Jedburgh. In consequence of the war with America, tobacco had continued to rise in price, till, in 1781, it reached the unprecedented price of two shillings the pound. Dr Jackson, a gentleman who possessed a small estate near Kelso, had for two years previous laid out a few acres in the culture of tobacco, the science of which he had learned from long experience in America. In 1781, his whole crop had been sold at the extraordinary rate of two shillings and sixpence a pound. His example and reputed success led others to follow in the same line. Even the minister of Jedburgh had five acres of his glebe laid out as a tobacco plantation; and his statement is that, in 1782, many thousands of acres in the counties of Roxburgh, Berwick, and Selkirk were planted with tobacco, nearly every farmer in these counties having devoted some considerable part of his arable land to this adventurous speculation. In Berwickshire, complaints were made that many acres of the best land were occupied with tobacco instead of being cropped with grain.

The year 1782 is notable as having been one of the most inclement seasons either in the eighteenth century or the present. Snow, which had fallen plentifully during the winter, remained so long on the ground that the sowing of grain was delayed at least a month after the ordinary time. The summer was uncommonly wet and cold; the harvest was so late that even in early districts corn was not cut down till October, while a great part of it was reaped only in November; and much of it in the higher grounds never ripened at all. Tobacco, like other crops, suffered from the cold rainy season; and its destruction was completed in the month of August by a thunderstorm of unusual violence, accompanied with a great fall of hail. The succulent leaves were riddled; many of the most luxuriant plants were destroyed; and the prospects of speculative farmers were seriously blighted.

The discomfiture of tobacco-planters, begun by the unpropitious season, was completed through the interference of Glasgow merchants. The tobacco trade in that city had gradually grown to large dimensions. It had begun in a small way soon after the union with England in 1707. At first, Glasgow merchants had no ships of their own, but were dependent on English vessels; and not till 1718 did the first Glasgow ship cross the Atlantic. Gradually the tobacco trade of Glasgow increased, till it roused the jealousy of merchants in London, Liverpool, Bristol, and Whitehaven, who made strenuous but unsuccessful efforts to crush those enterprising Scottish traders. The traffic continued to flourish till in 1775 there were fifty-seven thousand one hundred and forty-three hogsheads of tobacco imported from Virginia, Maryland, and Carolina. At the instance of these Glasgow merchants, the government officials came to understand that the revenue would suffer if tobacco grown in Scotland were

carried free of duty into England. Accordingly, an Act was passed in 1782 permitting the use and removal of tobacco, the growth of Scotland, into England for a limited time under certain restrictions; but liable to duties similar to those due and payable on the importation of such tobacco, the growth and produce of the British colonies or plantations in America.

By a subsequent Act, provision was made for granting relief to the proprietors of such tobacco, in consideration of the inferior quality thereof, or any accident or defect that may happen in the growth or culture of the crop so as to render the same not marketable or worth the duties imposed thereupon. For this purpose, it was enacted that the Commissioners of Customs at Edinburgh might allow, and order to be paid to the owner or proprietor of such tobacco, out of any revenue under their management which is applicable to the payment of incidents, at the rate of fourpence for every pound-weight thereof, for which the owner or proprietor thereof shall refuse to pay the full duties imposed by the said recited Act, provided the commodity shall be given up and *burned*, the owners being compensated at the rate of fourpence a pound. Even at that moderate figure, it was said that thirteen acres in the parish of Crailing brought one hundred and four pounds sterling, or about eight pounds an acre. The return would have been three times as much, but for the Act of Parliament which fixed the rate of compensation so low. Altogether, the county of Roxburgh was believed to have lost fifteen hundred pounds by the arrangement. The experiment was not renewed in 1783, one reason for which is doubtless indicated in the announcement made on the 21st of March that year, that 'tobacco has fallen fourpence a pound this week.'

The more recent experiments of growing tobacco near Kelso were, we understand, quite successful so far as plant-production of a good quality was concerned, but excise difficulties prevented the utilisation of the crop. It only remains for us to assure our readers that a tobacco plant, grown in a pot, is a pretty household ornament.

THE MONTH:

SCIENCE AND ARTS.

THE Japanese sanitarium, Kusatsu, possesses such important remedial properties that it is believed that when its reputation becomes more widely known in Western countries, patients will flock to it from all parts of the globe. Here, in the volcanic soil, are a series of natural baths of different temperatures, the waters of which are charged with sulphur, arsenic, copper, alumina, magnesia, in various proportions. To these baths come the halt, the maim, and even those who are as far blind as that too common disease ophthalmia can make them. They bathe here in waters which are described as caustic and evil-smelling, some of which consist of little else than dilute sulphuric acid. This treatment, owing to the great temperature and searching action of the different chemicals dissolved in the water, is often most agonising to the patients,

who can only hear it for several minutes at a time. But its efficacy in various species of disease is said to be most thorough, even incurable maladies being mitigated by these wonderful waters.

The *Builder* calls attention to the careless construction of flues and party-walls in houses, which constitutes a common cause of houses being burned down. The evil is best described by showing what occurred at a private house in London not many weeks ago. A smell of fire was detected, luckily in the daytime, when people were about and able to seek the cause. Upon examination of a certain flue, it was found that ties of fir covered with lead passed on each side of it. These ties had ignited, and had communicated their fire to a library bookcase. Although the Building Act forbids this mode of construction, there are many houses which were built before it became law, and doubtless a large proportion of them have wood in dangerous proximity to their flues. Although at the time of building, such woodwork may have been partially protected, the modern method of sweeping a chimney is apt to knock off projections and to move bricks out of place, thereby giving a ready means of access to fire.

At a recent meeting of the Academy of Sciences, Paris, a paper was read by M. Pasteur on his Treatment of Hydrophobia. As Pasteur's work has recently been much criticised, sometimes not too kindly, it may be as well briefly to state the results which he has recorded after inoculating nearly 2500 patients. Of these, 80 were English, 52 Austrians, 9 Germans, 107 Spaniards, 10 Greeks, 14 Dutch, 165 Italians, 25 Portuguese, 191 Russians, 1736 French and Algerians, and 54 of other nationalities. Confining his remarks to the French cases, as being, we presume, those only the subsequent history of which could be followed, M. Pasteur said that out of the large number stated, the inoculation had proved ineffectual in ten cases only. Six of these ten were children, and one a woman seventy years old. As a result of studying these failures, M. Pasteur came to the conclusion that for deep wounds his treatment was insufficient. He has now modified it by making the action more rapid and energetic for all cases, and he considers that this alteration has already been productive of very favourable results.

A Russian doctor says that he has successfully treated with cantharides some patients who were bitten by a rabid wolf. Three men were badly bitten by the animal in various parts of the body, and cantharides plasters were applied to the wounds. At the same time, powdered cantharides was administered to each in doses of one grain each day, until certain well-known symptoms were exhibited. These patients have now been in perfect health for eight months since the bites were given, and it is hoped that cantharides has thus proved a successful remedy to the dire disease with which they were threatened.

A petroleum engine has been invented by Herr Siegfried Marcus of Vienna, and adopted by the German government as a motor for torpedo boats. It is said to be far more powerful than a steam-engine of equal bulk, while its fuel takes up much less space than coal.

The engine is said to work well and without any risk of explosion.

We are always glad to note anything new in the way of utilising waste products, for such saving represents a distinct gain to the country. The last item of this kind that has been recorded is a method, which has been patented, of making use of spent dye liquors for the manufacture of writing-ink. The spent liquor of hichromeate of potash, or soda, such as may have been used for mordanting wool, &c., is boiled with the waste logwood liquor from dyeing-vats. The result, after certain additions have been made, is a non-corrosive and permanent ink.

A successful attempt has recently been made, near Liverpool, to acclimatise a beautiful variety of carp called the 'Golden Orfe,' a fish which comes from Bavaria. The ornamental gold-fish which are commonly seen in aquaria in our own country will not, as a rule, breed here, and if they do, their descendants are black rather than golden. But these Bavarian fish, while quite as beautiful, will breed freely, and their young will retain the colour of the parents. The fish is about one foot in length, and is said to attain a weight of six pounds. It will be valued by anglers for the reason that it will rise to a fly in waters which are inclosed, so that by its help fly-fishing may be still further enjoyed in landlocked waters. Some ponds near Liverpool have been stocked with this hopeful fish; and if present anticipations are realised, its culture will no doubt be taken up in other parts of the country.

The experimental crop of tobacco grown at Sydenham, close by the Crystal Palace, by Messrs Carter & Co., has, so far as cultivation and preparation for market are concerned, proved a decided success. The experiment shows that the fragrant weed can be produced and prepared by hands unused to the work, in an uncertain climate such as ours. The total crop raised by Messrs Carter covered only three-quarters of an acre of ground, and its estimated weight is about fifteen hundredweight, having a market value of forty-two pounds, or at the rate of fifty-six pounds per acre. This estimate is of course the value of the raw material free of all duty. The operations involved in tobacco-growing are such as could be undertaken by small cultivators, and it remains to be seen whether the government will allow this new kind of farming to be tried on a more extensive scale. Their decision should come quickly, so that farmers may have time to prepare their ground for the new crop.

A new method of preserving polyzoa and other low forms of life has been discovered by Dr A. Föttinger. Crystals of chloral hydrate are dropped into the vessel of water in which polypes have been placed, and in a short time the creatures become insensible, when they can be placed in alcohol. The advantage claimed for this method is that the polypes will remain expanded, and can therefore be preserved when exhibiting all their beauty of structure. The chloral acts, it would seem, in much the same manner as it affects higher organisms—that is, as a narcotic.

The extended use of the electric light in America seems to be by no means an unmixed blessing. It is said that in every town over a certain size the Companies are stringing their

wires over the streets to the danger of the inhabitants. But this danger does not arise from the risk of broken wires, so much as from wires which are so imperfectly insulated that the electric energy can escape to neighbouring telephone and telegraph lines. This is especially the case in storms, when the wires are swayed to and fro in the wind, and are often knocked together. The result of this is often a fire at the telephone or telegraph offices, sometimes leading to loss of life. It is said by telephone operators that it is not an uncommon thing to find, upon opening the office in the morning, that a telephone has been burned up during the night, its charred remains having fallen on the floor. It is evident that such accidents are preventable; but special legislation may be necessary to compel the Companies to adopt proper precautions against their occurrence.

Last month, we noticed certain improvements which have been made in the Electric Safety-lamp invented by Mr Swan of Newcastle. Another lamp of the same type has been contrived by Mr Miles Settle of Bolton. Mr Settle's lamp is an incandescent electric globe which floats in another glass globe of water. Should the glass, from any cause, break, the electric connection is broken too, and the lamp goes out. It is made in two sizes—one for main roads, and one for ordinary use. It gives a brilliant light, and is adapted for use in powder-magazines as well as in mines. Mr Settle is also the inventor of a water-cartridge which can be exploded in a fiery mine, or in one charged with coal-dust, without any fear of the surrounding medium catching fire. Both inventions have lately been subjected to experiments, which clearly prove their efficiency.

In view of the wonderful advances which have been recently made in the field of astronomical photography, it has been proposed by the Paris Academy of Sciences that an International Conference shall be held in the spring for the purpose of making arrangements for obtaining a complete chart of the heavens. This photographic map would be combined from many hundreds of photographs taken at ten or more observations in different parts of the globe. We shall have occasion again to refer to this important and deeply interesting subject.

It has long been admitted that if Britain is to retain her commercial position among the nations of the world, her workmen must have the advantages of technical education. Much has been done in this direction in recent years, but much more remains to be done. It would be as well if the various Institutes throughout the country were to follow the lead of the Finsbury Technical College, London. Here, a course of lectures on Electric Bells has been so well attended that it will shortly be repeated. Another course on Electro Deposition of Metals, with special reference to Nickel Plating, has been commenced. Following this will come the subject of Solders and Soldering. The intelligent working-man comes to these lectures, for he knows that he must learn something more than his father was master of, and that 'rule of thumb' must in these days give place to something more definite.

It is to be hoped that the conduct of an official at Bedford in deliberately handing to the public analyst a sample of beer which had been purposely

doctored with a poisonous drug, with a view to showing that customary analysis would not discover the addition, will not lead the unthinking to assume that chemical analysis is valueless. In examining a sample of beer, the analyst looks only for such ingredients as are liable to be used for its sophistication, such as sugar, added water, &c. In examining bread in like manner, he would look for alum or potato; in coffee, for chicory; and so on. But it would be quite outside his province to look for a mineral poison, unless he were told beforehand that the presence of such a poison was suspected. If it were the duty of the public analyst to search every sample of food submitted to him for all the poisons known to the world, each analysis would be an affair of many weeks, and his work would practically come to a standstill.

At the beginning of the year, a certain number of the new Enfield-Martini rifles were issued to our troops, and several adverse reports concerning their efficiency were the result. The weapons were returned to headquarters, and have now been reissued to Portsmouth, Aldershot, and the School of Musketry at Hythe. Those into whose hands they are placed are required to answer several questions as to the efficiency of various parts of the weapon, and general observations upon its merits or demerits are invited. It is thought in many quarters that it is now time that a magazine or repeating rifle should become the arm of the infantry. But it has long become the fashion for Britain not to lead, but to follow the lead of other countries in these matters. The plan has the advantage of benefiting by the experience of others, but it can be carried too far.

It was recently pointed out in an article which appeared in the *Times* how little we are indebted to native talent for the more deadly and exceptional implements of war. The Gatling, Gardner, Hotchkiss, and Maxim machine guns are due to American ingenuity, and the practical conception of the turret ship comes from the same source. Nordenfelt with his machine gun and his submarine boat is a Norwegian. But what will prove perhaps the most deadly thing of all is the dynamite cruiser, which is about to be built for the American navy. This is a boat two hundred and thirty feet in length, with engines which will insure a speed of twenty knots. She is to be built of steel, and furnished with twin screws. Her armament is to consist of three guns, seventy feet in length, to fire dynamite shells, propelled by compressed air. This form of gun was invented and tried with success some months ago, and at the time we described its construction as being similar to that of a pea-shooter. The cartridge of the gun is a copper drum containing two hundred pounds of dynamite, and its flight of two or three miles through the air is rendered steady by the attachment of a wooden shaft, which acts towards it as a stick does to a rocket. It is certain that no ship afloat could withstand the explosion of such a terrible projectile.

The Germans have found a new use for Professor Hughes's microphone in the detection of leaks in water-mains. The apparatus required consists of a steel rod, in addition to the microphone, telephone, and battery. The rod is placed upon the stopcock in the neighbourhood of which a leak is suspected; and by listening to the telephone placed in circuit with it and the microphone,

the slightest leakage is detected. If the stopcock is a good one and there is no leak, no sound is heard; but the least leakage causes a vibration, which is rendered audible by the microphone. The operation is so simple that it is readily acquired by unskilled hands.

As Mr Watts, the eminent Academician, has announced his intention of bequeathing his valuable paintings to the nation, more than ordinary interest must centre round the nine pictures which he has sent to the Kensington Museum as what he calls 'samples' of his work. These include several of his more recent productions. We may mention, too, that the collection of fifty-five pictures by the same hand, which for some months have been exhibited in Birmingham, is now removed to the Museum galleries at Nottingham Castle. Mr Watts' works will thus be rendered familiar to many thousands of people.

We hear of a very ingenious and valuable improvement upon the construction of the steam-engine, for which various patents have recently been issued. This invention, which hails from the Dunfermline Foundry Company, N.B., consists of a steam-valve of entirely original design, which can be moved with the greatest ease, as there is no steam-pressure on any of its working parts, causing considerable friction, as in the case of the slide-valve at present in use. Apart from the simplification of the steam-engine, where quick stoppage and reversing are important considerations, its great value lies in the certainty of its preventing various kinds of accidents of a mortal character. Thus, where miners are being hoisted to the pit-month, there is always a danger that the engine-man may lose control of the stopping arrangements, and a case of 'overwinding' is the result. The new valve, however, is so easily stopped, that the 'indicator' can be adjusted, so that when the cage reaches the platform at the pit-month, the steam is instantly cut off and overwinding rendered impossible. At sea, also, this valve will be most valuable, as the most powerful engines can be stopped and reversed with the greatest ease, and this cannot be said of the engines of the present day. The same remarks apply to locomotives. The valve has also been adapted to steam-winchies, and here another advantage presents itself, inasmuch as, should the winch be stopped while the load is upon the chain, the load remains suspended without the application of a brake; in other words, the winch does not run away, because the 'exhaust' steam does not leave the cylinder, but is inclosed as a steam-brake, keeping the piston immovable.

In the neighbourhood of the mining village of Broxburn, about twelve miles west of Edinburgh, are several large shale oil-works. In making a new bore in connection with one of these works lately, a petroleum spring was struck at one hundred and fifteen fathoms from the surface. In driving a mine at a later date, petroleum was observed coming out of the rocks. In a deep bore made in 1884 the same appearances of petroleum oozing from the rock were observed. It was the discovery of a petroleum spring at Alfreton, Derbyshire, by the late James Young, which set him thinking and experimenting, and led up to his famous discovery of the distillation of oil from

shale. In Scotland, this industry has flourished in recent years, the annual output of shale for this having reached the enormous quantity of two million tons.

OCCASIONAL NOTES.

MILK-DIET FOR INFANTS.

In an article on 'Infant-feeding,' contributed to the *Lancet*, Dr E. Paget Thurstan, M.D., publishes an interesting discovery that he has recently made. It has been very generally admitted that, inasmuch as salivary and pancreatic secretions are practically absent in newborn children, all farinaceous food should be avoided in their dietary. Dr Thurstan's discovery entails a departure from the letter, if not the spirit, of this axiom of child-rearing. Mothers are well aware that very young children cannot drink pure cow's milk, because it curdles in a lump in their stomachs. Certain chemical substances—notably lime-water—must be blended with the liquid to make it digestible. These auxiliaries, however, frequently produce sickness; and it is obviously undesirable to doctor a child with medicine for months together if it be not absolutely necessary. Some persons imagine they solve the problem by using condensed milk as infant-food. But Dr Thurstan points out that, though its curd is undoubtedly more digestible than that of uncondensed milk, the cane-sugar with which it is prepared, itself produces indigestion in a new form, while the condensation robs the liquid of much of its saline constituents, and removes material required for bone-formation. Hence he sought a new method of making cow's milk digestible to young children; and his final solution of the question is as simple as he declares it to be efficacious. He mixes with the milk a small quantity of farinaceous food, to secure a mechanical as opposed to a nutritive action. The particles of solid intermingle with the curds as they form, and thus prevent their coalescing into one large mass. Dr Thurstan suggests as appropriate agents the crust of bread—when free from alum and large quantities of potato starch—or any one of the many well-known infants' foods. He points out that they should be added to the milk in such small quantities and in such minute particles that it will easily pass through the tube of a feeding-bottle. Dr Thurstan mentions in detail the case of a weak and ailing child whose life was saved by this method of feeding.

WOOD-PULP.

A report comes from Norway of a discovery just made at the Sognedal Pulp Factory, after years of experimenting—that wood-pulp can be used for the manufacture of all kinds of building ornaments which are usually made in plaster of Paris, the pulp readily taking painting or gilding to great advantage. The material also seems to be remarkably tough, and not easily broken, as shown by the fact that a bar a foot long, an inch thick, and five inches wide, was thrown with great violence against a wall and sustained no injury. Pieces have also been dropped from great heights with the same

result. The material is lighter than plaster of Paris, is impervious to wet, and therefore admirably adapted for ceilings, ceiling ornaments, friezes, and such-like, both outdoor and indoor. It can easily be fixed either with nails or screws. One more advantage is claimed by the inventor—that ornaments made from this material cost half the price of similar ones made of plaster. If this discovery is really all that it is said to be, it will prove a useful adjunct to all kinds of ornamentation and architectural decoration, and ought therefore to be specially acceptable in the building trade.

M. DEPREZ' ELECTRICAL EXPERIMENTS.

A series of interesting experiments have been lately carried on by M. Deprez at Creil, at the sole expense of Messrs Rothschild, with the view to ascertain whether certain results can be obtained from one generator and one receptor. M. Deprez now finds that with these appliances he can transmit to a distance of thirty-five miles a force of fifty-two horse-power, and that the machinery is now working regularly and continuously. The maximum electro-motive force is 6290 volts, which is all the more remarkable; for before the construction of M. Deprez' apparatus, the maximum force did not exceed 2000. The transmitting wires may be left uncovered on poles, so long as they are high enough to be out of the reach of the hand. The cost of this arrangement to provide a circular line of seventy miles, for a fifty-horse power of transmission, is estimated at five thousand pounds; not a high price, when all the circumstances are considered; and a cost that would be lessened if the machines were to be frequently manufactured or brought into general use, which is much to be desired, as a new and very practicable motor-power will thus be made available for industrial purposes.

SWEET DAY OF DAYS.

On the moss-grown bridge I stand,
Where you gave me once your hand,
Where a story, new, yet old,
Once without a word was told.
Still the daylight slowly dies,
Ebbing from the tender skies;
Still the river creeps along.
Crooning yet its wistful song.
Day of days, sweet day of days,
Years their shadows round us raise;
Happy they who, looking on,
Still remember days ago!

Ah! of all sweet days that die,
Gone from sight and reach away,
Even as this flower I throw
Down the old gray stream will go.
Nay—it lingers—prisoned here,
Where the swaying willows rise,
Out of reach, love, like sweet days,
Lingering yet in memory's gaze!

Day of days, sweet day of days,
Years their shadows round us raise;
Happy they who, looking on,
Still remember days ago!

G. CLIFTON BINGHAM

Volume III. of the Fifth Series of CHAMBERS'S JOURNAL is now completed, price Nine Shillings.

A Title-page and Index, price One Penny, have been prepared, and may be ordered through any bookseller.

An elegant cloth case for binding the whole of the numbers for 1886 is also ready.

Back numbers to complete sets may at all times be had.

The First Monthly Part of the New Volume will contain the opening Chapters of an original Novel, entitled:

RICHARD CABLE

THE LIGHTSHIPMAN

BY THE AUTHOR OF 'MEHALAH,' 'JOHN HILBRING,' 'COÛET ROYAL,' ETC.

Also an interesting Novelette, entitled:

TOLD BY TWO

By T. W. SPEIGHT

END OF THE THIRD VOLUME

Printed and Published by W. and R. Chambers,
17 Paternoster Row, London, and 339 High Street, Edinburgh.

All Rights Reserved.
